A CLASSIFICATION OF SUBSYSTEMS OF A ROOT SYSTEM

TOSHIO OSHIMA

ABSTRACT. We classify isomorphic classes of the homomorphisms of a root system Ξ to a root system Σ which do not change Cartan integers. We examine different types of isomorphic classes defined by the Weyl group of Σ , that of Ξ and the automorphisms of Σ or Ξ etc. We also distinguish the subsystem generated by a subset of a fundamental system. We introduce the concept of the dual pair for root systems which helps to study the action of the outer automorphism of Ξ on the homomorphisms.

1. INTRODUCTION

Root systems were introduced by W. Killing and E. Cartan for the study of semisimple Lie algebras and now they are basic in several fields of mathematics. In this note a subsystem of a root system means a subset of a root system which is stable under the reflections with respect to the roots in the subset. The purpose of this note is to study subsystems of a root system. It is not difficult to classify the subsystems if the root system is of the classical type but we do it in a unified way. The method used here will be useful in particular when the root system is of the exceptional type.

Let Ξ and Ξ' be subsystems of a root system Σ . We define that Ξ' is equivalent to Ξ by Σ and we write $\Xi \sim_{\Sigma} \Xi'$ if $w(\Xi) = \Xi'$ with an element w of the Weyl group W_{Σ} of Σ . By the classification in this note we will get complete answers to the following fundamental questions (cf. Remark 10.2 for the answers).

- Q1. What kinds of subsystems of Σ exist as abstract root systems?
- Q2. Suppose Ξ' is isomorphic to Ξ as abstract root systems, which is denoted by $\Xi' \simeq \Xi$. How do we know $\Xi' \sim_{\Sigma} \Xi$?
- Q3. How many subsystems of Σ exist which are equivalent to Ξ ?
- Q4. Does the outer automorphism of Ξ come from W_{Σ} ?

Q5. Suppose σ is an outer automorphism of Ξ which stabilizes the irreducible components of Ξ . Is σ realized by an element of W_Σ ?

Q6. Suppose that Ξ is transformed to Ξ' by an outer automorphism of Σ . Is $\Xi \underset{\Sigma}{\sim} \Xi'$ valid?

Q7. Is Ξ equivalent to a subsystem $\langle \Theta \rangle$ generated by a subset Θ of a fundamental system Ψ of Σ ? How many elements exist in $\{\Theta \subset \Psi; \langle \Theta \rangle \underset{\Sigma}{\sim} \Xi\}$?

For example, Q5 may be interesting if Ξ has irreducible components which are mutually isomorphic to each other. Namely an orthogonal system is a typical example (cf. Remark 8.2).

To answer these questions we will study subsystems as follows. Let Ξ and Σ be reduced root systems and let $\text{Hom}(\Xi, \Sigma)$ denote the set of maps of Ξ to Σ which keep the Cartan integers $2\frac{(\alpha|\beta)}{(\beta|\beta)}$ invariant for the roots α and β . Since the map is injective and its image is a root system, the image is a subsystem of Σ isomorphic to Ξ .

Let W_Ξ and W_Σ denote the Weyl groups of Ξ and Σ respectively and put $\text{Aut}(\Xi) = \text{Hom}(\Xi, \Xi)$ and $\text{Aut}(\Sigma) = \text{Hom}(\Sigma, \Sigma)$. We will first study the most refined classification, that is, $W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)$ after the review of the standard materials for root systems in §2. In §3 we will give Theorem 3.3 which reduces the structure of $W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)$ to a simple graphic structure of the extended Dynkin diagrams. The theorem is a generalization of the fact that an element of $W_\Sigma \backslash \text{Aut}(\Sigma)$ corresponds to a graph automorphism of the Dynkin diagram associated to Σ (cf. Example 3.5) and the theorem is proved in §5 after the preparation in §4.

In §6 we introduce the dual pair of subsystems, which help us to study the action of $\text{Aut}(\Xi)$ on $\text{Hom}(\Xi, \Sigma)$. In §10 we give the table of all the non-empty $\text{Hom}(\Xi, \Sigma)$ with irreducible Σ . The table includes the list of the numbers of the elements of the cosets

$$W_\Sigma \backslash \text{Hom}(\Xi, \Sigma), \quad \text{Aut}(\Sigma) \backslash \text{Hom}(\Xi, \Sigma), \\ W_\Sigma \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}(\Xi), \quad W_\Sigma \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}'(\Xi)$$

and the number of the subsystems generated by subsets of a fundamental system of Σ which correspond to a coset. Here $\text{Aut}'(\Xi)$ is the subgroup of $\text{Aut}(\Xi)$ defined by the direct product of the automorphisms of the irreducible components of Ξ .

In many cases $\#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}(\Xi)) = 1$, which is equivalent to say that the subsystems of Σ which are isomorphic to Ξ form a single W_Σ -orbit. We will also distinguish the orbits when the number is larger than one.

In §8 we give some remarks obtained by our study. For example, the induced action of W_Σ on the orthogonal systems of type E_7 and E_8 will be examined.

In §9 we give the extended Dynkin diagrams and roots of the irreducible root systems following the notation in [Bo], which is for the reader's convenience and will be constantly used in this note.

Dynkin [Dy] classified regular subalgebras of a simple Lie algebra in his study of semisimple subalgebras. The classification is given by Table 11 in [Dy], where $A_6 + A_2$ and the second one of $A_7 + A_1$ should be replaced by $E_6 + A_2$ and $E_7 + A_1$, respectively, and it corresponds to the classification of $\text{Aut}(\Sigma) \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}(\Xi)$ for \mathcal{S} -closed subsystems (cf. Definition 6.6) in our table in §10. His table was obtained by successive procedures taking maximal subsystems, which correspond to removing one root from the (extended) Dynkin diagram of a root system. Our classification is based on Theorem 3.3, which gives the classification of $W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)$.

2. NOTATION

In this section we review the root systems and fix the notation related to them. All the materials in this section are elementary and found in [Bo].

Fix a standard inner product $(\cdot | \cdot)$ of \mathbb{R}^n and the orthonormal basis $\{\epsilon_1, \dots, \epsilon_n\}$ of \mathbb{R}^n . For $\alpha \in \mathbb{R}^n \setminus \{0\}$ the *reflection* s_α with respect to α is defined by

$$(2.1) \quad \begin{array}{ccc} s_\alpha : \mathbb{R}^n & \rightarrow & \mathbb{R}^n \\ \cup & & \cup \\ x & \mapsto & s_\alpha(x) := x - 2 \frac{(\alpha|x)}{(\alpha|\alpha)} \alpha \end{array}$$

Definition 2.1. A *reduced* root system of rank n is a finite subset Σ of $\mathbb{R}^n \setminus \{0\}$ which satisfies

$$(2.2) \quad \mathbb{R}^n = \sum_{\alpha \in \Sigma} \mathbb{R}\alpha,$$

$$(2.3) \quad s_\alpha(\Sigma) = \Sigma \quad (\forall \alpha \in \Sigma),$$

$$(2.4) \quad 2 \frac{(\alpha|\beta)}{(\alpha|\alpha)} \in \mathbb{Z} \quad (\forall \alpha, \beta \in \Sigma),$$

$$(2.5) \quad \mathbb{R}\alpha \cap \Sigma = \{\pm\alpha\} \quad (\forall \alpha \in \Sigma).$$

In general the rank of a root system Σ is denoted by $\text{rank } \Sigma$.

Remark 2.2. i) In this note any non-reduced root system doesn't appear and hereafter for simplicity a root system always means a *reduced* root system.

ii) We use the notation \mathbb{N} for the set $\{0, 1, 2, \dots\}$ of non-negative integers.

Definition 2.3. A *fundamental system* Ψ of the root system Σ of rank n is a finite subset $\{\alpha_1, \dots, \alpha_n\}$ of Σ which satisfies

$$(2.6) \quad \mathbb{R}^n = \mathbb{R}\alpha_1 + \mathbb{R}\alpha_2 + \dots + \mathbb{R}\alpha_n,$$

$$(2.7) \quad \alpha = \sum_{j=1}^n m_j(\alpha) \alpha_j \in \Sigma \Rightarrow (m_1(\alpha), \dots, m_n(\alpha)) \in \mathbb{N}^n \text{ or } -\mathbb{N}^n.$$

The fundamental system Ψ exists for any root system Σ and the root $\alpha \in \Sigma$ is *positive* (with respect to Ψ) if $m_j(\alpha) \geq 0$ for $j = 1, \dots, n$, which is denoted by $\alpha > 0$.

Definition 2.4. Let Θ be a finite subset of Σ and put

$$(2.8) \quad W_\Theta := \langle s_\alpha ; \alpha \in \Theta \rangle = \text{the group generated by } \{s_\alpha ; \alpha \in \Theta\},$$

$$(2.9) \quad W := W_\Sigma = W_\Psi,$$

$$(2.10) \quad \langle \Theta \rangle := W_\Theta \Theta,$$

$$(2.11) \quad \Theta^\perp = \Theta^\perp \cap \Sigma := \{\alpha \in \Sigma ; (\alpha|\beta) = 0 \quad (\forall \beta \in \Theta)\}.$$

The reflection group W generated by s_α for $\alpha \in \Sigma$ is called the *Weyl group* of Σ . A subset Ξ of Σ is called a *subsystem* of Σ if $s_\alpha(\Xi) = \Xi$ for any $\alpha \in \Xi$. Then Ξ is a root system with $\text{rank } \Xi = \dim \sum_{\alpha \in \Xi} \mathbb{R}\alpha$. Note that $\langle \Theta \rangle$ and Θ^\perp are subsystems of Σ and

$$(2.12) \quad \text{rank} \langle \Theta \rangle + \text{rank } \Theta^\perp \leq \text{rank } \Sigma.$$

Definition 2.5. The map ι of a root system Ξ to a root system Σ is a *homomorphism* if ι keeps the Cartan integers:

$$(2.13) \quad 2 \frac{(\iota(\alpha)|\iota(\beta))}{(\iota(\alpha)|\iota(\alpha))} = 2 \frac{(\alpha|\beta)}{(\alpha|\alpha)} \quad (\forall \alpha, \beta \in \Xi).$$

In this case ι is injective and $\iota(\Xi)$ is a subsystem of Σ .

The set of all homomorphisms of Ξ to Σ is denoted by $\text{Hom}(\Xi, \Sigma)$ and define

$$(2.14) \quad \text{Aut}(\Sigma) := \text{Hom}(\Sigma, \Sigma).$$

Note that W_Σ and W_Ξ naturally act on $\text{Hom}(\Xi, \Sigma)$ and

$$(2.15) \quad \iota \circ s_\alpha = s_{\iota(\alpha)} \circ \iota \quad (\iota \in \text{Hom}(\Xi, \Sigma), \alpha \in \Xi).$$

Two homomorphisms ι and ι' of Ξ to Σ are *isomorphic* if

$$(2.16) \quad \iota' = w \circ \iota$$

for a suitable $w \in W_\Sigma$ and we define

$$(2.17) \quad \overline{\text{Hom}}(\Xi, \Sigma) := W_\Sigma \backslash \text{Hom}(\Xi, \Sigma) \simeq W_\Sigma \backslash \text{Hom}(\Xi, \Sigma) / W_\Xi,$$

$$(2.18) \quad \text{Out}(\Sigma) := W_\Sigma \backslash \text{Aut}(\Sigma) = \overline{\text{Hom}}(\Sigma, \Sigma) \simeq \text{Aut}(\Sigma) / W_\Sigma$$

$$(2.19) \quad \overset{\sim}{\leftarrow} \{g \in \text{Aut}(\Sigma); g(\Psi) = \Psi\}.$$

The root system Ξ is *isomorphic to* Σ , which is denoted by $\Xi \simeq \Sigma$, if there exists a surjective homomorphism of Ξ onto Σ .

Suppose Σ_1 and Σ_2 are the subsystems of Σ such that $\Sigma = \Sigma_1 \cup \Sigma_2$ and $\Sigma_1 \perp \Sigma_2$. Then we say that Σ is a *direct sum* of Σ_1 and Σ_2 , which is denoted by $\Sigma = \Sigma_1 + \Sigma_2$. The *irreducible root system* is a root system which has no non-trivial direct sum decomposition. Note that every root system is decomposed into a direct sum of irreducible root systems.

For root systems Σ_1 and Σ_2 there exists a root system $\Sigma = \Sigma'_1 + \Sigma'_2$ such that $\Sigma_j \simeq \Sigma'_j$ for $j = 1$ and 2 . This root system Σ is determined modulo isomorphisms and hence we simply write $\Sigma = \Sigma_1 + \Sigma_2$. When $\Sigma_1 = \Sigma_2$, we sometimes write $2\Sigma_1$ in place of $\Sigma_1 + \Sigma_2$.

For any two elements α and α' in Ψ , there exists an isomorphism ι of $\langle \alpha, \alpha' \rangle$ to one of the following four root systems with the fundamental system $\{\beta, \beta'\}$ such that $\iota(\alpha) = \beta$ and $\iota(\alpha') = \beta'$:

$$\begin{array}{ll} A_1 + A_1 = 2A_1: (\beta, \beta') = (\epsilon_1, \epsilon_2) & 2 \frac{(\beta|\beta')}{(\beta|\beta)} = 0, \quad 2 \frac{(\beta|\beta')}{(\beta'|\beta')} = 0 \quad \begin{array}{c} \beta \quad \beta' \\ \circ \quad \circ \end{array} \\ A_2: (\beta, \beta') = (\epsilon_1 - \epsilon_2, \epsilon_2 - \epsilon_3) & 2 \frac{(\beta|\beta')}{(\beta|\beta)} = -1, \quad 2 \frac{(\beta|\beta')}{(\beta'|\beta')} = -1 \quad \begin{array}{c} \beta \quad \beta' \\ \circ \text{---} \circ \end{array} \\ B_2: (\beta, \beta') = (\epsilon_1 - \epsilon_2, \epsilon_2) & 2 \frac{(\beta|\beta')}{(\beta|\beta)} = -1, \quad 2 \frac{(\beta|\beta')}{(\beta'|\beta')} = -2 \quad \begin{array}{c} \beta \quad \beta' \\ \circ \text{====} \circ \end{array} \\ G_2: (\beta, \beta') = (-2\epsilon_1 + \epsilon_2 + \epsilon_3, \epsilon_1 - \epsilon_2) & 2 \frac{(\beta|\beta')}{(\beta|\beta)} = -1, \quad 2 \frac{(\beta|\beta')}{(\beta'|\beta')} = -3 \quad \begin{array}{c} \beta \quad \beta' \\ \circ \text{====} \circ \end{array} \end{array}$$

The *Dynkin diagram* $G(\Psi)$ of a root system Σ with the fundamental system Ψ is the graph which consists of vertices expressed by small circles and edges expressed by some lines or arrows such that the vertices are associated to the elements of Ψ . The lines or arrows connecting two vertices represent the isomorphic classes of the corresponding two roots in Ψ according to the above Dynkin diagram of rank 2. Here the number of lines which link β and β' in the diagram equals $\frac{4(\beta|\beta')^2}{(\beta|\beta)(\beta'|\beta')}$.

Definition 2.6. A root α of an irreducible root system Σ is called *maximal* and denoted by α_{max} if every number $m_j(\alpha)$ for $j = 1, \dots, n$ in Definition 2.3 is maximal among the roots of Σ . It is known that the maximal root uniquely exists.

Let $\Psi = \{\alpha_1, \dots, \alpha_n\}$ be a fundamental system of Σ . Define

$$(2.20) \quad \alpha_0 := -\alpha_{max},$$

$$(2.21) \quad \tilde{\Psi} := \Psi \cup \{\alpha_0\}.$$

The *extended Dynkin diagram* of Σ in this note is the graph $G(\tilde{\Psi})$ associated to $\tilde{\Psi}$ which is defined in the same way as $G(\Psi)$ associated to Ψ . We call $\tilde{\Psi}$ the *extended fundamental system* of Σ .

A *subdiagram* of $G(\tilde{\Psi})$ is the Dynkin diagram $G(\Theta)$ with a certain subset $\Theta \subset \tilde{\Psi}$.

In §9 the list of the extended Dynkin diagrams of all the irreducible root systems is given, which is based on the notation in [Bo]. The vertex expressed by a circled circle in the diagram corresponds to the special root α_0 . If the vertex and the lines starting from it are removed from the diagram, we get the corresponding Dynkin diagram of the irreducible root system. The numbers below vertices α_j in the diagram in §9 are the numbers $m_j(\alpha_{max})$.

Remark 2.7. i) There is a bijection between the isomorphic classes of root systems and the Dynkin diagrams.

The irreducible decomposition of a root system Σ corresponds to the decomposition of its Dynkin diagram $G(\Psi)$ into the connected components $G(\Psi_j)$. It also induces the decomposition of the fundamental system $\Psi = \Psi_1 \amalg \cdots \amalg \Psi_m$ such that $\Sigma = \langle \Psi_1 \rangle + \cdots + \langle \Psi_m \rangle$ is the decomposition into irreducible root systems. Then we call each Ψ_j an *irreducible component* of Ψ .

The irreducible root systems are classified as follows (cf. §9):

$$(2.22) \quad A_n(n \geq 1), B_n(n \geq 2), C_n(n \geq 3), D_n(n \geq 4), E_6, E_7, E_8, F_4, G_2.$$

We will also use this notation A_n, \dots for a root system or a fundamental system. For example, $A_2 + 2B_3$ means a root system isomorphic to the direct sum of the root system of type A_2 and two copies of the root system of type B_3 or it means its fundamental system.

ii) $\text{Out}(\Sigma)$ is naturally isomorphic to the group of graph automorphisms of the Dynkin diagram associated to Σ . If Σ is irreducible, it also corresponds to the graph automorphisms of the extended Dynkin diagram which fix the vertex corresponding to α_0 . Here we give the list of irreducible root systems Σ with non-trivial $\text{Out}(\Sigma)$:

$$(2.23) \quad \begin{cases} \text{Out}(A_n) \simeq \mathbb{Z}/2\mathbb{Z} & (n \geq 2), \\ \text{Out}(D_4) \simeq \mathfrak{S}_3 & (= \text{the symmetric group of degree 3}), \\ \text{Out}(D_n) \simeq \mathbb{Z}/2\mathbb{Z} & (n \geq 5), \\ \text{Out}(E_6) \simeq \mathbb{Z}/2\mathbb{Z}. \end{cases}$$

iii) The graph automorphism σ of the extended Dynkin diagram $G(\tilde{\Psi})$ with the following property corresponds to a transformation by an element of W_Σ .

$$(2.24) \quad \begin{cases} \text{A rotation of } G(\tilde{\Psi}) & (\Sigma = A_n, E_6), \\ \text{Any automorphism} & (\Sigma = B_n, C_n, E_7), \\ \sigma((\alpha_0, \alpha_1, \alpha_{n-1}, \alpha_n)) = (\alpha_1, \alpha_0, \alpha_n, \alpha_{n-1}) & (\Sigma = D_n), \\ \sigma((\alpha_0, \alpha_1, \alpha_{n-1}, \alpha_n)) = (\alpha_n, \alpha_{n-1}, \alpha_1, \alpha_0) & (\Sigma = D_n, n : \text{even} \geq 4), \\ \sigma((\alpha_0, \alpha_1, \alpha_{n-1}, \alpha_n)) = (\alpha_n, \alpha_{n-1}, \alpha_0, \alpha_1) & (\Sigma = D_n, n : \text{odd}) \end{cases}$$

When Σ is irreducible, we have the bijection:

$$(2.25) \quad \begin{array}{ccc} \{w \in W_\Sigma; w(\tilde{\Psi}) = \tilde{\Psi}\} & \xrightarrow{\sim} & \{\alpha_j \in \Psi; m_j(\alpha_{max}) = 1\} \cup \{\alpha_0\} \\ \Downarrow & & \Downarrow \\ \sigma & \mapsto & \sigma(\alpha_0) \end{array}$$

To classify subsystems contained in a root system we prepare more definitions.

Definition 2.8. We put

$$(2.26) \quad \text{Aut}'(\Xi) := \text{Aut}(\Xi_1) \times \cdots \times \text{Aut}(\Xi_m) \subset \text{Aut}(\Xi),$$

$$(2.27) \quad \text{Out}'(\Xi) := \text{Aut}'(\Xi)/W_\Xi$$

for a root system Ξ with an irreducible decomposition $\Xi = \Xi_1 + \cdots + \Xi_m$.

Definition 2.9. Let Ξ , Ξ' and Θ be subsystems of Σ .

$$(2.28) \quad \Xi \underset{\Theta}{\sim} \Xi' \Leftrightarrow \exists w \in W_{\Theta} \text{ such that } \Xi' = w(\Xi),$$

$$(2.29) \quad \Xi \underset{\Theta}{\overset{w}{\sim}} \Xi' \Leftrightarrow \exists g \in \text{Aut}(\Theta) \text{ such that } \Xi' = g(\Xi).$$

If $\Xi \underset{\Theta}{\sim} \Xi'$ (resp. $\Xi \underset{\Theta}{\overset{w}{\sim}} \Xi'$), we say that Ξ' is *equivalent* (resp. *weakly equivalent*) to Ξ by Θ . Since $\text{Aut}(\Xi) \simeq \{\iota \in \text{Hom}(\Xi, \Sigma); \iota(\Xi) = \Xi\}$, we have

$$(2.30) \quad \begin{aligned} & \{\Xi' \subset \Sigma; s_{\alpha}(\Xi') = \Xi' (\forall \alpha \in \Xi') \text{ and } \Xi' \simeq \Xi\} / \underset{\Sigma}{\sim} \\ & \simeq W_{\Sigma} \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}(\Xi) \\ & \simeq \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}(\Xi), \end{aligned}$$

$$(2.31) \quad \begin{aligned} & \{\Xi' \subset \Sigma; s_{\alpha}(\Xi') = \Xi' (\forall \alpha \in \Xi') \text{ and } \Xi' \simeq \Xi\} / \underset{\Sigma}{\overset{w}{\sim}} \\ & \simeq \text{Aut}(\Sigma) \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}(\Xi) \\ & \simeq \text{Out}(\Sigma) \backslash \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}(\Xi), \end{aligned}$$

$$(2.32) \quad W_{\Sigma} \backslash \text{Hom}(\Xi, \Sigma) / \text{Aut}'(\Xi) \simeq \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}'(\Xi).$$

Definition 2.10 (fundamental subsystems). A subsystem Ξ of Σ is called *fundamental* if there exists $\Theta \subset \Psi$ such that $\Xi \underset{\Sigma}{\sim} \langle \Theta \rangle$.

Remark 2.11. Suppose Σ is of type A_n . Then it is clear that

$$(2.33) \quad \text{any subsystem of } \Sigma \text{ is fundamental,}$$

$$(2.34) \quad (\Xi \underset{\Sigma}{\sim} \Xi' \Leftrightarrow \Xi \simeq \Xi') \text{ for subsystems } \Xi \text{ and } \Xi' \text{ of } \Sigma.$$

Our aim in this note is to clarify the structure of

$$\begin{aligned} & \overline{\text{Hom}}(\Xi, \Sigma), \text{Out}(\Sigma) \backslash \overline{\text{Hom}}(\Xi, \Sigma), \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}(\Xi), \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}'(\Xi), \\ & \text{Out}(\Sigma) \backslash \overline{\text{Hom}}(\Xi, \Sigma) / \text{Out}(\Xi) \text{ and fundamental subsystems of } \Sigma. \end{aligned}$$

For this purpose we prepare the following definition.

Definition 2.12. i) A root $\alpha \in \Psi$ (resp. $\tilde{\Psi}$) is an *end root* of Ψ (resp. $\tilde{\Psi}$) if

$$(2.35) \quad \#\{\beta \in \Psi \text{ (resp. } \tilde{\Psi}); (\beta, \alpha) < 0\} \leq 1.$$

A root $\alpha \in \Psi$ (resp. $\tilde{\Psi}$) is called a *branching root* of Ψ (resp. $\tilde{\Psi}$) if

$$(2.36) \quad \#\{\beta \in \Psi \text{ (resp. } \tilde{\Psi}); (\beta, \alpha) < 0\} \geq 3.$$

The corresponding vertex in the (extended) Dynkin diagram is also called an end vertex or a branching vertex, respectively.

ii) When Σ is irreducible, we put

$$(2.37) \quad \Sigma^L := \{\alpha \in \Sigma; |\alpha| = |\alpha_{max}|\}$$

and denote its fundamental system by $\tilde{\Psi}^L$. Then Σ^L is a subsystem of Σ and

$$(2.38) \quad \begin{aligned} A_n^L &= A_n, B_n^L = D_n (n \geq 2), C_n^L = nA_1 (n \geq 3), D_n^L = D_n (n \geq 4), \\ E_6^L &= E_6, E_7^L = E_7, E_8^L = E_8, F_4^L = D_4, G_2^L = A_2. \end{aligned}$$

3. A THEOREM

In this section we will give a simple procedure to clarify the set $\overline{\text{Hom}}(\Xi, \Sigma) := W_\Sigma \setminus \text{Hom}(\Xi, \Sigma)$ for root systems Ξ and Σ .

Remark 3.1. i) Note that

$$(3.1) \quad \text{Hom}(\Xi, \Sigma_1 + \Sigma_2) \simeq \coprod_{\Xi' \subset \Xi: \text{component}} (\text{Hom}(\Xi', \Sigma_1), \text{Hom}((\Xi')^\perp, \Sigma_2)),$$

$$(3.2) \quad \text{Hom}(\Xi_1 + \Xi_2, \Sigma) \simeq \coprod_{\iota \in \text{Hom}(\Xi_1, \Sigma)} (\iota, \text{Hom}(\Xi_2, \iota(\Xi_1)^\perp)).$$

Here the *component* Ξ' of Ξ is the subsystem of Ξ such that $\Xi = \Xi' + (\Xi')^\perp$. The empty set and Ξ are also components of Ξ .

The identification (3.2) follows from

$$(3.3) \quad \{w \in W_\Sigma; w|_{\iota(\Xi)} = id\} = W_{\iota(\Xi)^\perp} \subset W_\Sigma$$

for any $\iota \in \text{Hom}(\Xi, \Sigma)$ (cf. [Bo]).

ii) The identifications (3.1) and (3.2) assure that we may assume Ξ and Σ are irreducible. In fact, the study of the structure of $\text{Hom}(\Xi, \Sigma)$ is reduced to the study of $\iota \in \text{Hom}(\Xi, \Sigma)$ and $\iota(\Xi)^\perp$ for irreducible Ξ and Σ .

We may moreover assume $\iota(\Xi) \cap \Sigma^L \neq \emptyset$ by considering the dual root systems $\Xi^\vee := \{\frac{2\alpha}{(\alpha|\alpha)}; \alpha \in \Xi\}$ and $\Sigma^\vee := \{\frac{2\alpha}{(\alpha|\alpha)}; \alpha \in \Sigma\}$ in place of Ξ and Σ , respectively.

Definition 3.2. When $G(\Phi)$ is isomorphic to a subdiagram $G(\Theta)$ of $G(\tilde{\Psi})$ with a map $\bar{\iota}: \Phi \rightarrow \Theta \subset \tilde{\Psi}$, it is clear that $\bar{\iota}$ defines an element of $\text{Hom}(\Xi, \Sigma)$. In this case we say that $\bar{\iota}$ is an *imbedding* of $G(\Phi)$ into $G(\tilde{\Psi})$.

Recalling Definition 2.4, 2.6 and 2.12, we now state a theorem in this note, which is a generalization of the description of $\text{Out}(\Sigma) = \overline{\text{Hom}}(\Sigma, \Sigma)$ in Remark 2.7 ii).

Theorem 3.3. *Let Ξ and Σ be irreducible root systems and let Φ and Ψ be their fundamental systems, respectively. Denoting*

$$(3.4) \quad \text{Hom}'(\Xi, \Sigma) := \{\iota \in \text{Hom}(\Xi, \Sigma); \iota(\Xi) \cap \Sigma^L \neq \emptyset\},$$

$$(3.5) \quad \overline{\text{Hom}}'(\Xi, \Sigma) := W_\Sigma \setminus \text{Hom}'(\Xi, \Sigma),$$

we have the following claims according to the type of Ξ :

1) Ξ is of type A_m .

$$\overline{\text{Hom}}'(\Xi, \Sigma) \simeq \{\text{Imbeddings } \bar{\iota} \text{ of } G(\Phi) \text{ into } G(\tilde{\Psi}) \text{ with the end vertex } \alpha_0\}.$$

Let $\bar{\iota}$ be this graph imbedding corresponding to $\iota \in \text{Hom}(\Xi, \Sigma)$. Then

$$(3.6) \quad \iota(\Xi)^\perp \simeq \langle \alpha \in \Psi; \alpha \perp \bar{\iota}(\Phi) \rangle.$$

In the case $\#\overline{\text{Hom}}'(\Xi, \Sigma) > 1$, we have $\#\overline{\text{Hom}}'(\Xi, \Sigma) = 3$ if (Ξ, Σ) is of type (A_3, D_4) and 2 if otherwise. Moreover for $\bar{\iota}, \bar{\iota}' \in \overline{\text{Hom}}'(\Xi, \Sigma)$

$$(3.7) \quad \begin{aligned} & \text{“}\bar{\iota} \text{ and } \bar{\iota}' \text{ are conjugate under an element of } \text{Out}(\Sigma) \text{ or } \text{Out}(\Xi)\text{”} \\ & \Leftrightarrow \iota(\Xi)^\perp \simeq \iota'(\Xi)^\perp. \end{aligned}$$

2) Ξ is of type D_m ($m \geq 4$).

Let $\Phi_m = \{\beta_0, \dots, \beta_{m-1}\}$ be a fundamental system of Ξ with the Dynkin diagram

an imbedding $\bar{\iota}_m$ of $G(\Phi_m)$ into $G(\tilde{\Psi}^L)$. We put $m_\Sigma = 0$ if such imbedding doesn't exist. Then

$$m_\Sigma = \begin{cases} 0 & (\Sigma \text{ is of type } A_n, C_n, G_2), \\ \text{rank } \Sigma & (\Sigma \text{ is of type } B_n, D_n, E_8, F_4), \\ 5 & (\Sigma \text{ is of type } E_6), \\ 6 & (\Sigma \text{ is of type } E_7) \end{cases}$$

and

$$\begin{aligned} \text{Hom}'(D_m, \Sigma) \neq \emptyset &\Leftrightarrow (4 \leq) m \leq m_\Sigma \\ &\Leftrightarrow \#(\overline{\text{Hom}}'(\Xi, \Sigma)/\text{Out}(\Xi)) = 1. \end{aligned}$$

Σ is of type E_6, E_7 or E_8 .

$$\begin{aligned} \#\overline{\text{Hom}}(D_m, \Sigma) &= \begin{cases} 2 & (m = m_\Sigma), \\ 1 & (4 \leq m < m_\Sigma), \end{cases} \\ \iota(\Xi)^\perp \simeq D_{m_\Sigma - m} + \begin{cases} A_1 & (n = 7), \\ \emptyset & (n = 6, 8). \end{cases} \end{aligned}$$

Σ is of type D_n, B_n or F_4 ($m \leq n$).

$$\begin{aligned} \#\overline{\text{Hom}}'(\Xi, \Sigma) &= \begin{cases} 6 & (\Sigma : D_4 \ (m = n = 4)), \\ 3 & (\Sigma : B_n \text{ and } D_n \ (m = 4 < n)), \\ 2 & (\Sigma : D_n \ (4 < m = n)), \\ 1 & (\Sigma : F_4 \ (4 = m), B_n \ (4 < m \leq n), D_n \ (4 < m < n)), \end{cases} \\ \iota(\Xi)^\perp \simeq \begin{cases} D_{n-m} & (\iota \in \text{Hom}(D_m, D_n)), \\ B_{n-m} & (\iota \in \text{Hom}(D_m, B_n)), \\ \emptyset & (\iota \in \text{Hom}(D_4, F_4)). \end{cases} \end{aligned}$$

3) Ξ is of type B_m ($m \geq 2$).

$$\begin{aligned} \text{Hom}(\Xi, \Sigma) \neq \emptyset &\Leftrightarrow \#\overline{\text{Hom}}(\Xi, \Sigma) = 1 \text{ and } \begin{cases} \Sigma \text{ is of type } B_n \text{ with } m \leq n, \\ \Sigma \text{ is of type } C_n \text{ with } m = 2, \\ \Sigma \text{ is of type } F_4 \text{ with } m \leq 4, \end{cases} \\ \iota(\Xi)^\perp \cap T_n \simeq T_{n-m} &\quad (T = B, C, F, F_2 = B_2, F_1 = A_1 \text{ and } \iota(B_3)^\perp \cap F_4 \not\subset \Sigma^L). \end{aligned}$$

4) Ξ is of type C_m ($m \geq 3$).

$$\begin{aligned} \text{Hom}(\Xi, \Sigma) \neq \emptyset &\Leftrightarrow \#\overline{\text{Hom}}(\Xi, \Sigma) = 1 \text{ and } \begin{cases} \Sigma \text{ is of type } C_n \text{ with } m \leq n, \\ \Sigma \text{ is of type } F_4 \text{ with } m \leq 4, \end{cases} \\ \iota(\Xi)^\perp \cap T_n \simeq T_{n-m} &\quad (T = C, F, F_2 = C_2, F_1 = A_1 \text{ and } \iota(C_3)^\perp \cap F_4 \subset \Sigma^L). \end{aligned}$$

5) Ξ is of type E_m ($m = 6, 7$ and 8).

$$\begin{aligned} \overline{\text{Hom}}(\Xi, \Sigma) &\simeq \{ \text{Imbeddings } \bar{\iota} \text{ of } G(\Phi) \text{ into } G(\tilde{\Psi}) \} / \sim, \\ \iota(\Xi)^\perp &\simeq \langle \alpha \in \Psi ; \alpha \perp \bar{\iota}(\Phi) \rangle. \end{aligned}$$

Here $/\sim$ is interpreted that all the imbeddings of $G(\Phi)$ are considered to be isomorphic except for $(\Xi, \Sigma) \simeq (E_6, E_6)$. Namely $\#\overline{\text{Hom}}(\Xi, \Sigma) \leq 1$ if $(\Xi, \Sigma) \not\cong (E_6, E_6)$.

6) Ξ is of type G_2 or F_4 .

$$\text{Hom}(\Xi, \Sigma) \neq \emptyset \Leftrightarrow \#\overline{\text{Hom}}(\Xi, \Sigma) = 1 \text{ and } \Xi \simeq \Sigma.$$

Remark 3.4. i) In the proof of Theorem 3.3 2) we will have

$$\iota(\Xi)^\perp \simeq \begin{cases} \langle \bar{\iota}_{m_\Sigma}(\Phi_{m_\Sigma})^\perp \cap \Psi \rangle & (m_\Sigma - 1 \leq m \leq m_\Sigma), \\ \langle \bar{\iota}_{m_\Sigma}(\Phi_{m_\Sigma})^\perp \cap \Psi, \bar{\iota}_{m_\Sigma}(\beta_m), \dots, \bar{\iota}_{m_\Sigma}(\beta_{m_\Sigma-1}) \rangle & (4 \leq m \leq m_\Sigma - 2) \end{cases}$$

for the imbedding $\bar{\iota}_{m_\Sigma}$ with $\bar{\iota}(\beta_{m_\Sigma}) = \alpha_0$ if Σ is of type D_n, E_6, E_7 or E_8 .

Let Θ_m be a subset of $\tilde{\Psi}$ such that $\langle \Theta_m \rangle \simeq D_m$. If Σ is of type B_n or D_n , we may assume that $\iota_m \in \overline{\text{Hom}}(D_m, \Sigma)$ satisfies $\iota_m(\Xi) = \langle \Theta_m \rangle$ and then

$$(3.8) \quad \iota_m(\Phi_m)^\perp = \langle \Theta_m^\perp \cap \tilde{\Psi} \rangle.$$

Suppose Σ is of type E_6, E_7 or E_8 . Let α'_{max} be the maximal root of $\langle \Theta_{m_\Sigma} \rangle$. Put $\alpha'_0 = -\alpha'_{max}$ and $\tilde{\Theta}_{m_\Sigma} = \Theta_{m_\Sigma} \cup \{\alpha'_0\}$. We may assume $\iota_m \in \overline{\text{Hom}}(D_m, \Sigma)$ satisfies $\iota_m(\Xi) = \langle \Theta_m \rangle$ and $\Theta_m \subset \tilde{\Theta}_{m_\Sigma}$. Then

$$(3.9) \quad \iota_m(\Phi_m)^\perp = \langle \Theta_m^\perp \cap \tilde{\Theta}_{m_\Sigma}, \Theta_{m_\Sigma}^\perp \cap \tilde{\Psi} \rangle.$$

Note that $G(\tilde{\Theta}_{m_\Sigma})$ is the extended Dynkin diagram of $\langle \Theta_{m_\Sigma} \rangle \simeq D_{m_\Sigma}$. See Example 3.5 viii) and ix).

ii) Using a graph automorphism of $G(\tilde{\Psi})$ corresponding to a suitable element of W_Σ , we may replace α_0 by another element α_j of Ψ with $m_j(\alpha_{max}) = 1$ in Theorem 3.3 i) and in the remark above (cf. Remark 2.7 ii)).

Example 3.5. ($\text{Hom}(\Xi, \Sigma)$ and Ξ^\perp)

i) $\#\overline{\text{Hom}}(A_2, A_n) = 2$ and $A_2^\perp \cap A_n \simeq A_{n-3}$ ($n \geq 2$).

Two elements of $\#\overline{\text{Hom}}(A_2, A_n)$ are defined by $(\alpha_1, \alpha_2) \mapsto (\alpha_0, \alpha_1)$ and $(\alpha_1, \alpha_2) \mapsto (\alpha_0, \alpha_n)$, respectively. They are isomorphic to each other under $\text{Out}(A_2)$. Note that the rotation of the extended Dynkin diagram corresponds to an element of W_{A_n} .

ii) $\#\overline{\text{Hom}}(A_3, D_4) = 3$, $\#(\text{Out}(D_4) \setminus \overline{\text{Hom}}(A_3, D_4)) = 1$ and $A_3^\perp \cap D_4 = \emptyset$.

The group $\text{Out}(D_4) \simeq \mathfrak{S}_3$ corresponds to the graph automorphisms of the extended Dynkin diagram which fix α_0 .

iii) $\#\overline{\text{Hom}}(A_3, D_n) = \#(\text{Out}(D_n) \setminus \overline{\text{Hom}}(A_3, D_n) / \text{Out}(A_3)) = 2$ for $n > 4$.

$A_3^\perp \cap D_n \simeq D_{n-3}$ or D_{n-4} according to the imbeddings $A_3 \subset D_n$.

iv) $\#\overline{\text{Hom}}(A_2, E_6) = 1$ and $A_2^\perp \cap E_6 \simeq 2A_2$. Then $3A_2 \subset E_6$ and $\#\overline{\text{Hom}}(3A_2, E_6) = \#\overline{\text{Hom}}(2A_2, 2A_2) = 8$ (cf. §8.2.5).

v) $\#\overline{\text{Hom}}(A_4, E_6) = 2$, $\#(\text{Out}(E_6) \setminus \overline{\text{Hom}}(A_4, E_6)) = 1$ and $A_4^\perp \cap E_6 \simeq A_1$.

vi) $\#\overline{\text{Hom}}(A_5, E_7) = \#(\text{Out}(E_7) \setminus \overline{\text{Hom}}(A_5, E_7) / \text{Out}(A_5)) = 2$.

$A_5^\perp \cap E_7 \simeq A_2$ or A_1 according to the imbeddings $A_5 \subset E_7$.

vii) $\#\overline{\text{Hom}}(4A_1, D_4) = 6$ and $\#(\text{Out}(D_4) \setminus \overline{\text{Hom}}(4A_1, D_4)) = 1$.

viii) $\#\overline{\text{Hom}}(D_4, E_n) = 1$ (cf. Remark 3.4 i))

ix) $\#\overline{\text{Hom}}(D_5, D_9) = \#\overline{\text{Hom}}(D_5, B_9) = 1$ (cf. Remark 3.4 i)).

x) $\#\overline{\text{Hom}}(A_4 + A_2, E_8) = 2$ and $\#(\overline{\text{Hom}}(A_4 + A_2, E_8) / \text{Out}(A_4 + A_2)) = 1$.

The two reductions $\overline{\text{Hom}}(A_2, A_4^\perp)$ and $\overline{\text{Hom}}(A_4, A_2^\perp)$ given below lead to the same result (cf. Remark 3.1). In particular $(A_4 + A_2)^\perp \cap E_8 \simeq A_1$. Note that (A_4, A_4) and (A_2, E_6) are special dual pairs in E_8 (cf. Definition 6.3).

Corollary 3.6. i) Suppose Σ is not of type A. Let $G(\{\alpha_0, \alpha_{j_1}, \dots, \alpha_{j_{m-1}}\})$ be a maximal subdiagram of $G(\tilde{\Psi})$ isomorphic to $G(A_m)$ such that α_0 and $\alpha_{j_{m-1}}$ are the end vertices of the subdiagram and α_{j_ν} are not the branching vertex of $G(\tilde{\Psi})$ for $\nu = 1, \dots, m-2$. Then

$$\begin{aligned} \#\overline{\text{Hom}}'(A_k, \Sigma) &= 1 \quad (k = 1, \dots, m), \\ \#\overline{\text{Hom}}'(A_{m+1}, \Sigma) &\begin{cases} = 0 & (\alpha_{j_{m-1}} \text{ is not a branching vertex of } G(\tilde{\Psi})) \\ > 1 & (\alpha_{j_{m-1}} \text{ is a branching vertex of } G(\tilde{\Psi})) \end{cases} \end{aligned}$$

with

$$m = \begin{cases} 2 & (\Sigma = B_n, n \geq 3), & 1 & (\Sigma = B_2, C_n), \\ 2 & (\Sigma = D_n, n \geq 4), \\ 3 & (\Sigma = E_6), & 4 & (\Sigma = E_7), & 6 & (\Sigma = E_8), \\ 3 & (\Sigma = F_4), & 2 & (\Sigma = G_2). \end{cases}$$

Here $\alpha_{j_{m-1}}$ is the branching vertex if $\Sigma = B_n$ ($n \geq 3$), D_n ($n \geq 4$), E_6 , E_7 or E_8 .

ii) We consider the following procedure for a Dynkin diagram X :

If X is connected, we replace it by the subdiagram X' of the extended Dynkin diagram \tilde{X} of X where the vertices of X' correspond to the roots orthogonal to the maximal root of \tilde{X} . If an irreducible component of X' has no root with the length of the maximal root, we remove the component.

If X is not connected, we choose one of the connected component of X and change the component by the above procedure.

Then $\overline{\text{Hom}}(rA_1, \Sigma)$ corresponds to the r steps of the above procedures starting from $G(\Psi)$. The existence of these steps implies $\text{Hom}'(rA_1, \Sigma) \neq \emptyset$ and in this case $\overline{\text{Hom}}(rA_1, \Sigma) = 1$ if and only if any non-connected Dynkin diagram does not appear except for the final step. In particular, we have the following:

Let $r(\Sigma)$ be the maximal integer r satisfying $\text{Hom}'(rA_1, \Sigma) \neq \emptyset$. Then

$$(3.10) \quad r(\Sigma) = 1 + \sum_j r(\Sigma'_j).$$

Here $\{\Sigma'_j\}$ is the set of irreducible components of α_0^\perp such that $\Sigma'_j \cap \Sigma^\perp \neq \emptyset$ and

$$\begin{aligned} r(A_n) &= 1 + r(A_{n-2}) = \lfloor \frac{n+1}{2} \rfloor & (n \geq 2), & \quad r(A_1) = 1, \quad r(A_0) = 0, \\ r(B_n) &= 2 + r(B_{n-2}) = 2 \lfloor \frac{n}{2} \rfloor & (n \geq 4), & \quad r(B_3) = r(B_2) = 2, \\ r(C_n) &= 1 + r(C_{n-1}) = n & (n \geq 3), & \quad r(C_2) = 2, \\ r(D_n) &= 2 + r(D_{n-2}) = 2 \lfloor \frac{n}{2} \rfloor & (n \geq 4), & \quad r(D_3) = r(D_2) = 2, \\ r(E_6) &= 1 + r(A_5) = 4, & & \quad r(E_7) = 1 + r(D_6) = 7, \\ r(E_8) &= 1 + r(E_7) = 8, \\ r(F_4) &= 1 + r(C_3) = 4, & & \quad r(G_2) = 1. \end{aligned}$$

Remark 3.7. i) If Σ is of type A , D or E , then $\overline{\text{Hom}}(rA_1, \Sigma)$ is figured as follows according to the procedures in Corollary 3.6 ii) and the notation in §9.

$$\begin{array}{ccccccccccc} A_n & \longrightarrow & A_{n-2} & \longrightarrow & A_{n-4} & \longrightarrow & A_{n-6} & \longrightarrow & \cdots & D_n & \longrightarrow & D_{n-2} + A_1 & \longrightarrow & \cdots \\ E_6 & \xrightarrow{\alpha_0} & A_5 & \xrightarrow{\frac{\epsilon_1 + \cdots + \epsilon_4 - \epsilon_5 + \epsilon_6 + \epsilon_7 - \epsilon_8}{2}} & A_3 & \xrightarrow{\epsilon_4 - \epsilon_1} & A_1 & \xrightarrow{\epsilon_3 - \epsilon_2} & \emptyset & E_8 & \xrightarrow{-\epsilon_7 - \epsilon_8} & E_7 \\ E_7 & \xrightarrow{\epsilon_7 - \epsilon_8} & D_6 & \xrightarrow{-\epsilon_5 - \epsilon_6} & D_4 + A_1 & \begin{array}{l} \xrightarrow{-\epsilon_3 - \epsilon_4} 4A_1 \\ \xrightarrow{\epsilon_6 - \epsilon_5} D_4 \end{array} & \begin{array}{l} \xrightarrow{\epsilon_4} 3A_1 \\ \xrightarrow{\epsilon_6 - \epsilon_5} 3A_1 \end{array} & \begin{array}{l} \xrightarrow{\epsilon_3 - \epsilon_2} 2A_1 \\ \xrightarrow{\epsilon_3 - \epsilon_2} 2A_1 \end{array} & \xrightarrow{\epsilon_3 - \epsilon_2} & A_1 & \longrightarrow & \emptyset \end{array}$$

There appears $3A_1$ twice in the above. They are distinguished by the structure of $(3A_1)^\perp \cap E_7$ but isomorphic in E_8 (cf. §7.2, §7.3 and §8.2.3).

For example, it follows from the procedures shown above that

$$\begin{aligned} \# \overline{\text{Hom}}(5A_1, E_7) &= \# \overline{\text{Hom}}(4A_1, D_6) = \# \overline{\text{Hom}}(3A_1, D_4 + A_1) \\ (3.11) \quad &= \# \overline{\text{Hom}}(2A_1, D_4) + \# \overline{\text{Hom}}(2A_1, 4A_1) \\ &= \# \overline{\text{Hom}}(A_1, 3A_1) + 4 \# \overline{\text{Hom}}(A_1, 3A_1) = 3 + 4 \cdot 3 = 15. \end{aligned}$$

ii) For an irreducible root system Σ , we can easily calculate $\#\overline{\text{Hom}}(\Xi, \Sigma)$ and $\Xi^\perp \cap \Sigma$ for any root system Ξ in virtue of Theorem 3.3 together with Remark 3.1 (cf. Example 3.4 x)). The complete list for non-trivial $\overline{\text{Hom}}(\Xi, \Sigma)$ is given in §10. More refined structures related to the actions of $\text{Out}(\Sigma)$ and $\text{Out}(\Xi)$ etc. are also given in §10, which will be studied in later sections.

4. LEMMAS

In this section we always assume that Ψ is a fundamental system of an *irreducible* root system Σ and $\tilde{\Psi}$ is the corresponding extended fundamental system.

First note that for $\alpha \in \tilde{\Psi} \cap \Sigma^L$ we have

$$(4.1) \quad 2 \frac{(\alpha|\beta)}{(\alpha|\alpha)} \in \begin{cases} \{0, -1\} & (\forall \beta \in \langle \Psi \setminus \{\alpha\} \rangle \text{ and } \beta > 0), \\ \{0, 1\} & (\forall \beta \in \langle \Psi \setminus \{\alpha\} \rangle \text{ and } \beta < 0). \end{cases}$$

Here we put $\Psi \setminus \{\alpha\} = \Psi$ if $\alpha \notin \Psi$.

Lemma 4.1. *If a subset Θ of $\tilde{\Psi}$ contains α_0 and the diagram $G(\Theta)$ is connected,*

$$(4.2) \quad \Theta^\perp = \langle \alpha \in \tilde{\Psi}; \alpha \perp \Theta \rangle.$$

Proof. Note that $(\alpha_i|\alpha_j) \leq 0$ for $0 \leq i < j \leq n$.

We will prove the lemma by the induction on $\#\Theta$.

We may put $\Theta = \{\alpha_0, \alpha_1, \dots, \alpha_m\}$ and we may assume $\Theta' := \{\alpha_0, \alpha_1, \dots, \alpha_{m-1}\}$ is empty or forms a connected subdiagram.

Let $\alpha = \sum_{j=1}^n m_j(\alpha)\alpha_j \in \Theta^\perp$ with $m_j(\alpha) \geq 0$. Then the induction hypothesis for Θ' implies $m_j(\alpha) = 0$ for $j \leq m$ and

$$0 = (\alpha_m|\alpha) = \sum_{j=m+1}^n m_j(\alpha)(\alpha_m|\alpha_j).$$

Hence $(\alpha_m|\alpha_j) \neq 0$ means $m_j(\alpha) = 0$. □

Lemma 4.2. *Fix $\Theta \subset \Psi$. The fibre of the map*

$$p_\Theta : \begin{array}{ccc} \Sigma^L & \rightarrow & \mathbb{N}^{\#\Theta} \\ \Psi & & \Psi \\ \beta = \sum_{\alpha_i \in \Psi} m_i(\beta)\alpha_i & \mapsto & (m_i(\beta))_{\alpha_i \in \Theta} \end{array}$$

is a single $W_{\Psi \setminus \Theta}$ -orbit except for the null fiber $p_\Theta^{-1}(0)$.

Proof. Fix $0 \neq \mathbf{m} = (m_i)_{\alpha_i \in \Theta}$ in the image of p_Θ and put

$$\Sigma_{\mathbf{m}} := \Sigma \cap \left(\sum_{\alpha_i \in \Theta} m_i \alpha_i + \sum_{\alpha \in \Psi \setminus \Theta} \mathbb{R} \alpha \right).$$

Let \mathfrak{g} be the complex simple Lie algebra with the root system Σ and let $X_\alpha \in \mathfrak{g}$ be a root vector for $\alpha \in \Sigma$. We denote by $\mathfrak{g}_{\Psi \setminus \Theta}$ the semisimple Lie algebra generated by $\{X_\alpha; \alpha \in \Psi \setminus \Theta\}$. Then the space

$$V_{\mathbf{m}} := \sum_{\alpha \in \Sigma_{\mathbf{m}}} \mathbb{C} X_\alpha \subset \mathfrak{g}$$

is a $\mathfrak{g}_{\Psi \setminus \Theta}$ -stable subset in the adjoint representation of \mathfrak{g} , which is an irreducible representation of $\mathfrak{g}_{\Psi \setminus \Theta}$ as is shown in [OO, Proposition 2.39 ii)].

Let π_Θ be the orthogonal projection of \mathbb{R}^n onto $\sum_{\alpha \in \Psi \setminus \Theta} \mathbb{R} \alpha$ with respect to $(|)$. Put $v_{\mathbf{m}} = \sum_{\alpha_i \in \Theta} m_i \alpha_i - \pi_\Theta(\sum_{\alpha_i \in \Theta} m_i \alpha_i)$. Then

$$\pi_\Theta(\alpha) = \alpha - v_{\mathbf{m}}, \quad (\pi_\Theta(\alpha)|\pi_\Theta(\alpha)) = (\alpha|\alpha) - (v_{\mathbf{m}}|v_{\mathbf{m}}) \quad (\forall \alpha \in \Sigma_{\mathbf{m}}).$$

The set of the weights of the irreducible representation $(\mathfrak{g}_{\Psi \setminus \Theta}, V_{\mathbf{m}})$ is $\pi_{\Theta}(\Sigma_{\mathbf{m}})$ and the set of the weights with the longest length (i.e. extreme weights) is $\pi_{\Theta}(p_{\Theta}^{-1}(\mathbf{m}))$. Hence $\pi_{\Theta}(p_{\Theta}^{-1}(\mathbf{m}))$ is a single $W_{\Psi \setminus \Theta}$ -orbit. \square

Lemma 4.3 (roots orthogonal to the end root). *Suppose α_1 is an end root of Ψ with $\alpha_1 \in \Sigma^L$. Then the set*

$$(4.3) \quad Q = \left\{ \alpha = \alpha_1 + \sum_{j=2}^n m_j(\alpha) \alpha_j \in \Sigma^L; (\alpha | \alpha_1) = 0 \right\}$$

is empty if Ψ is of type A and it is a single $W_{\{\alpha_1\}^\perp}$ -orbit if otherwise.

Proof. We may assume $\#\Psi > 1$. Then there is a unique $\beta \in \Psi$ with $(\alpha_1 | \beta) < 0$. We may assume $\beta = \alpha_2$ and we have

$$Q = \left\{ \alpha = \alpha_1 + 2\alpha_2 + \sum_{j=3}^n m_j(\alpha) \alpha_j \in \Sigma^L \right\}.$$

Then $Q = \emptyset$ if and only if Ψ is of type A. If Ψ is not of type A, Lemma 4.2 assures that Q is a single $W_{\Psi \setminus \{\alpha_1, \alpha_2\}}$ -orbit. Here $\alpha_1^\perp = \langle \Psi \setminus \{\alpha_1, \alpha_2\} \rangle$. \square

Lemma 4.4 (special imbeddings of A_2 and A_3). *Let $\Psi' \subset \Psi$. If $\Psi' \neq \Psi$, we assume that we can choose $\alpha' \in \Psi \cap \Sigma^L$ with $\alpha' \notin \Psi'$. If $\Psi' = \Psi$, we put $\alpha' = \alpha_0$. Define*

$$\begin{aligned} Q_1 &:= \{ \beta \in \langle \Psi' \rangle \cap \Sigma^L; (\beta | \alpha') < 0 \}, \\ Q_2 &:= \{ (\beta_1, \beta_2) \in \langle \Psi' \rangle \cap \Sigma^L \times \langle \Psi' \rangle \cap \Sigma^L; \\ &\quad (\beta_1, \alpha') = (\beta_2 | \alpha') < 0 \text{ and } (\beta_1 | \beta_2) = 0 \}, \\ \Theta &:= \{ \alpha \in \Psi'; (\alpha | \alpha') < 0 \}, \\ \Theta_L &:= \Theta \cap \Sigma^L. \end{aligned}$$

Then Θ_L is the set of complete representatives of $Q_1/W_{\Psi' \setminus \Theta}$. Moreover if $\Psi' \neq \Psi$,

$$Q_2 / \#W_{\Psi' \setminus \Theta} = \# \Theta_L (\# \Theta_L - 1)$$

$$+ \{ \alpha \in \Theta_L; G(\Psi'_\alpha) \text{ is not of type A or not an end root of } G(\Psi'_\alpha) \}.$$

Here Ψ'_α is the irreducible component of Ψ' containing $\alpha \in \Theta_L$.

Proof. Let $\beta \in Q_1$. It follows from (4.1) that there exists $\alpha_m \in \Psi'$ satisfying

$$(4.4) \quad \beta = \alpha_m + \sum_{\alpha_j \in \Psi' \setminus \Theta} m_j(\beta) \alpha_j,$$

$$(4.5) \quad (\alpha_m | \beta) < 0.$$

Since $\alpha_m \in W_{\Psi' \setminus \Theta} \beta$ by lemma 4.2, $\alpha_m \in \Theta_L$.

Let $\alpha_m, \alpha_{m'} \in \Theta_L$ with $m \neq m'$. It is clear $\alpha_{m'} \notin W_{\Psi' \setminus \Theta} \alpha_m$ and therefore Θ_L is the set of complete representatives of $Q_1/W_{\Psi' \setminus \Theta}$.

Let $(\beta_1, \beta) \in Q_2$. We may assume $\beta_1 = \alpha_k \in \Theta_L$ by the argument above and β is of the form (4.4) with $\alpha_m \in \Theta_L$.

If $k \neq m$, we may similarly assume $\beta = \alpha_m$ and $(\alpha_k, \alpha_m) \in Q_2$.

Suppose $k = m$. If α_m is the end root of Ψ_{α_m} , it follows from Lemma 4.3 that Ψ'_{α_m} is not of type A and (α_k, β) corresponds to a unique element of $Q_2/W_{\Psi' \setminus \Theta}$.

If α_m is not the end root of Ψ'_{α_m} , Ψ'_{α_m} is of type A and it is easy to see that (α_k, β) also corresponds to a unique class in $Q_2/W_{\Psi' \setminus \Theta}$. In fact, we may put $\{\alpha \in \Psi_{\alpha_m}; (\alpha|\alpha_m) < 0\} = \{\alpha_p, \alpha_q\}$ and

$$\beta = \alpha_m + \alpha_p + \alpha_q + \sum_{\substack{\alpha_j \in \Psi' \\ j \neq m, p, q}} m_j(\beta)\beta \in \Sigma.$$

Note that the roots β with this expression are in a single $W_{\Psi' \setminus \{\alpha_m, \alpha_p, \alpha_q\}}$ -orbit. Thus we have the lemma. \square

5. PROOF OF THE MAIN THEOREM

Retain the notation in Theorem 3.3 to prove it.

1) Let Ξ be of type A_{m+1} with the fundamental system $\Phi = \{\beta_0, \dots, \beta_m\}$ and

the Dynkin diagram $\beta_0 \text{---} \beta_1 \cdots \beta_{m-1} \beta_m$.

First note that $\bar{\iota}$ naturally corresponds to an element of $\text{Hom}'(\Xi, \Sigma)$ and then (3.6) follows from lemma 4.1. We will prove the theorem by the induction on m .

Let $\iota \in \text{Hom}'(\Xi, \Sigma)$. Since $\{\alpha \in \Sigma; |\alpha| = |\alpha_{max}|\} = W_{\Sigma}\alpha_{max}$, the theorem is clear when $m = 0$. Suppose $m \geq 1$. By the induction hypothesis we may assume that there exists a unique sequence $(\alpha_0, \dots, \alpha_{m-1})$ of element of $\tilde{\Psi}$ and an element $w \in W_{\Sigma}$ such that $w \circ \iota(\beta_j) = \alpha_j$ for $j = 0, \dots, m-1$.

Put $\alpha'_m = w \circ \iota(\beta_m)$ and

$$\begin{aligned} \Psi' &= \{\alpha \in \tilde{\Psi}; (\alpha|\alpha_j) = 0 \quad (j = 0, \dots, m-2)\}, \\ \Theta &= \{\alpha \in \Psi'; (\alpha|\alpha_{m-1}) < 0\}. \end{aligned}$$

Since $(\alpha'_m|\alpha_j) = 0$ for $j = 0, \dots, m-2$, $\alpha'_m \in \langle \Psi' \rangle$. Applying Lemma 4.4 to $\alpha' := \alpha_{m-1}$, we have $\alpha_m \in \Theta \cap \Sigma^L$ and $w' \in W_{\Psi' \setminus \Theta}$ such that $w'(\alpha'_m) = \alpha_m$. Hence $w'w \circ \iota$ corresponds to a required imbedding of $G(\Phi)$ into $G(\Psi)$.

The uniqueness of $\alpha_m \in \Theta \cap \Sigma^L$ is proved as follows. Suppose there exists $w \in W_{\Sigma}$ such that

$$w\alpha_j = \alpha_j \quad \text{for } j = 0, \dots, m-1 \quad \text{and} \quad w\alpha_m \in \Theta \cap \Sigma^L.$$

Then $w \in W_{\Psi' \setminus \Theta}$ and Lemma 4.4 assures $w\alpha_m = \alpha_m$.

Thus we have proved the first claim and then Lemma 4.1 assures (3.6). The last claim is easily obtained by applying the claims we have proved to the extended Dynkin diagrams in §9.

2) Let Ξ is of type D_m with $m \geq 4$. We may assume that Σ is of type B_n, D_n, E_n or F_n .

Let $\iota \in \text{Hom}'(\Xi, \Sigma)$. Theorem 3.3 1) assures that there exists a unique sequence $\alpha_0, \alpha_{j_1}, \dots, \alpha_{j_{m-3}}$ in $\tilde{\Psi}$ and an element $w \in W_{\Sigma}$ such that

$$(5.1) \quad w \circ \iota(\beta_\nu) = \alpha_{j_\nu} \quad (\nu = 0, \dots, m-3) \text{ with } j_0 = 0.$$

Putting

$$\begin{aligned} \Psi' &= \{\alpha \in \Psi, (\alpha|\alpha_{j_\nu}) = 0 \quad (\nu = 0, \dots, m-3)\}, \\ \Theta &= \{\alpha \in \Psi'; (\alpha, \alpha_{j_{m-3}}) < 0\}, \\ \alpha' &= \alpha_{j_{m-3}}, \\ (\beta, \beta') &= (w \circ \iota(\beta_{m-2}), w \circ \iota(\beta_{m-1})), \end{aligned}$$

we have $\beta, \beta' \in \langle \Psi' \rangle$ and we can apply Lemma 4.4 as in the case when Ξ is of type A . Thus

$$\begin{aligned} & \#W_\Sigma \setminus \{ \iota \in \text{Hom}'(\Xi, \Sigma); \exists w \in W_\Sigma \text{ such that (5.1) holds.} \} \\ &= (\#(\Theta \cap \Sigma^L))(\#(\Theta \cap \Sigma^L) - 1) + \# \{ \alpha \in \Theta \cap \Sigma^L : \text{the irreducible component of} \\ & \quad \Psi' \text{ containing } \alpha \text{ is not of type } A \text{ or } \alpha \text{ is not an end vertex of the component} \}. \end{aligned}$$

Hence $\text{Hom}'(D_m, \Sigma) = \emptyset$ if Σ is of type A_n, C_n or G_2 or $m > \text{rank } \Sigma$. Moreover we have $\# \overline{\text{Hom}}(D_m, \Sigma)$ shown in the following table under the notation in §10.

Σ	Ξ	Ψ'	#
D_4	D_4	$\{\alpha_1, \alpha_3, \alpha_4\} \simeq 3A_1$	6
D_5	D_4	$\Psi \setminus \{\alpha_2\} \simeq A_1 + A_3 (\ni \alpha_3 : \text{not an end root})$	3
$D_n (n \geq 6)$	D_4	$\Psi \setminus \{\alpha_2\} \simeq A_1 + D_{n-2}$	3
B_4	D_4	$\Psi \setminus \{\alpha_2\} \simeq A_1 + B_2$	3
F_4	D_4	$\Psi \setminus \{\alpha_1\} \simeq C_3$	1
$D_n (4 < m = n)$	D_m	$\{\alpha_{n-1}, \alpha_n\} \simeq 2A_1$	2
$D_n (4 < m = n-1)$	D_m	$\{\alpha_{n-2}, \alpha_{n-1}, \alpha_n\} \simeq A_3 (\ni \alpha_{n-2} : \text{not an end root})$	1
$D_n (4 < m < n-2)$	D_m	$\{\alpha_{m-1}, \dots, \alpha_n\} \simeq D_{n-m+1}$	1
$B_n (4 < m < n)$	D_m	$\{\alpha_{m-1}, \dots, \alpha_n\} \simeq B_{n-m+1}$	1
E_6	D_4	$\Psi \setminus \{\alpha_2\} \simeq A_5 (\ni \alpha_4 : \text{not an end root})$	1
	D_5	$\{\alpha_1, \alpha_3, \alpha_5, \alpha_6\} \simeq 2A_2$	2
E_7	D_4	$\Psi \setminus \{\alpha_1\} \simeq D_6$	1
	D_5	$\{\alpha_2, \alpha_4, \dots, \alpha_7\} \simeq A_5 (\ni \alpha_4 : \text{not an end root})$	1
	D_6	$\{\alpha_2, \alpha_5, \alpha_6, \alpha_7\} \simeq A_1 + A_3 (\ni \alpha_5 : \text{an end root})$	2
E_8	D_4	$\Psi \setminus \{\alpha_8\} \simeq E_7$	1
	D_5	$\{\alpha_1, \dots, \alpha_6\} \simeq E_6$	1
	D_6	$\{\alpha_1, \dots, \alpha_5\} \simeq D_5$	1
	D_7	$\{\alpha_1, \alpha_2, \alpha_3, \alpha_4\} \simeq A_4 (\ni \alpha_4 : \text{not an end root})$	1
	D_8	$\{\alpha_2, \alpha_1, \alpha_3\} \simeq A_1 + A_2$	2

Here m_Σ is the rank of the maximal subdiagram of type D_m contained in the extended Dynkin diagram of Σ^L and then

$$(5.2) \quad m_\Sigma = \begin{cases} n & (\Sigma \text{ is of type } B_n \text{ or } D_n), \\ 5, 6, 8 & (\Sigma \text{ is of type } E_6, E_7 \text{ or } E_8, \text{ respectively}). \end{cases}$$

$$(5.3) \quad \begin{array}{ccc} \begin{array}{c} \alpha_1 \quad \alpha_2 \quad \alpha_3 \quad \alpha_4 \quad \dots \quad \alpha_{n-2} \quad \alpha_{n-1} \\ \circ \quad \circ \quad \circ \quad \circ \quad \dots \quad \circ \quad \circ \\ \vdots \\ \circ \quad \alpha_0 \end{array} & \begin{array}{c} \alpha_1 \quad \alpha_2 \quad \alpha_3 \quad \alpha_4 \quad \dots \quad \alpha_{n-1} \quad \alpha_n \\ \circ \quad \circ \quad \circ \quad \circ \quad \dots \quad \circ \quad \circ \\ \vdots \\ \circ \quad \alpha_0 \end{array} \\ \\ \begin{array}{c} \alpha_1 \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \\ * \quad \circ \quad \circ \quad \circ \quad \circ \quad * \\ \vdots \\ \circ \quad \alpha_2 \\ \vdots \\ \circ \quad \alpha_0 \end{array} & \begin{array}{c} \alpha_0 \quad \alpha_1 \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \quad \alpha_7 \\ \circ \quad \circ \quad \circ \quad \circ \quad \circ \quad \circ \quad \bullet \\ \vdots \\ \circ \quad \alpha_2 \\ \vdots \\ \circ \quad \alpha_0 \end{array} & \begin{array}{c} \alpha_1 \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \quad \alpha_7 \quad \alpha_8 \quad \alpha_0 \\ * \quad \circ \quad \circ \quad \circ \quad \circ \quad \circ \quad \circ \quad \circ \\ \vdots \\ \circ \quad \alpha_2 \\ \vdots \\ \circ \quad \alpha_0 \end{array} \end{array}$$

Fix $\iota \in \text{Hom}(D_4, F_4)$. Since $\text{Hom}(D_4, F_4)$ is a single W_{F_4} -orbit, for any $g \in \text{Aut}(D_4)$ there exists $w_g \in W_{F_4}$ with $\iota \circ g = w_g \circ \iota$. Here w_g is uniquely determined by g because $\text{rank } F_4 = \text{rank } D_4$. Hence we have

$$(5.4) \quad \begin{aligned} \text{Aut}(D_4) &\simeq W_{F_4} \supset \text{Aut}(B_4) = W_{B_4} \supset W_{D_4}, \\ \text{Out}(D_4) &\simeq \mathfrak{S}_3, \quad W_{B_4}/W_{D_4} \simeq \mathbb{Z}/2\mathbb{Z}. \end{aligned}$$

Let $\iota : D_4 \subset D_n (\subset B_n)$ be the natural imbedding given by the realization in §9 and let $g \in \text{Aut}(D_4)$ be a non-trivial rotation of $G(D_4)$. Then it is easy to see

$\iota \circ g \neq w \circ \iota$ for any $w \in W_{B_n}$. Hence if $n \geq 4$, we have

$$(5.5) \quad \#(\overline{\text{Hom}}(D_4, D_n)/\text{Out}(D_4)) = \#(\overline{\text{Hom}}(D_4, B_n)/\text{Out}(D_4)) = 1$$

because $\#(\overline{\text{Hom}}(D_4, D_n)) = \#(\overline{\text{Hom}}(D_4, B_n)) = 3$ and moreover we have

$$(5.6) \quad D_m^\perp \cap D_n \simeq D_{n-m}, \quad D_m^\perp \cap B_n \simeq B_{n-m}$$

for $m = 4$. Here $D_0 = D_1 = B_0 = \emptyset$, $D_2 \simeq 2A_1$, $B_1 \simeq A_1^S$ and A_1^S is the root space of type A_1 such that $A_1^S \cap (B_n)^L = \emptyset$.

Note that

$$(5.7) \quad \text{Aut}(D_n) \simeq W_{B_n} \text{ and } \text{Out}(D_n) := \text{Aut}(D_n)/W_{D_n} \simeq \mathbb{Z}/2\mathbb{Z} \quad (n \geq 5)$$

under the natural imbedding $D_n \subset B_n$ of root spaces. Thus we have

$$(5.8) \quad \#(\overline{\text{Hom}}(D_m, \Sigma)/\text{Out}(D_m)) = 0 \text{ or } 1 \text{ if } m \geq 4 \text{ and } \Sigma \text{ is irreducible}$$

and therefore $\{\iota(D_m)^\perp; \iota \in \text{Hom}(D_m, \Sigma)\}$ is a single W_Σ -orbit if it is non-empty.

Thus we have (5.6) for $4 \leq m \leq n$ since it does not depend on the imbedding of D_m .

Let $n \in \{6, 7, 8\}$ and put $m = m_{E_n}$. There exists $\iota \in \text{Hom}(D_m, E_n)$ such that ι corresponds to the imbedding of Φ_{m_Σ} to $\tilde{\Psi}$ with $\iota(\beta_0) = \alpha_0$. Then we have $D_5^\perp \cap E_6 = \emptyset$, $D_6^\perp \cap E_7 \simeq A_1$ and $D_8^\perp \cap E_8 = \emptyset$ from Lemma 4.1.

Moreover there exists $\iota' \in \text{Hom}(D_{m-1}, E_n)$ such that

$$\iota'(D_{m-1}) = \{\iota(\beta_0), \dots, \iota(\beta_{m-3}), \iota(\beta_{m-3}) + \iota(\beta_{m-2}) + \iota(\beta_{m-1})\}$$

and it is clear that $D_{m-1}^\perp \cap E_n \simeq D_m^\perp \cap E_n$.

Let $4 \leq k \leq 6$. Then $D_k^\perp \cap E_8 \supset D_k^\perp \cap D_8 \simeq D_{8-k}$ and we can conclude $D_k^\perp \cap E_8 \simeq D_{8-k}$ because $\text{rank}(D_k^\perp \cap E_8) \leq 8 - k$ and there is no root system containing D_{8-k} as a proper subsystem such that its roots have the same length and its rank is not larger than $8 - k$.

Since $D_6^\perp \cap E_7 \simeq A_1$ and $D_4^\perp \cap D_6 \simeq 2A_1$, $D_4^\perp \cap E_7 \supset 3A_1$ and we have $D_4^\perp \cap E_7 \simeq 3A_1$ by the same argument as above.

Thus we have obtained the claims in the theorem and therefore Remark 3.4 i) is also clear.

3) Suppose Ξ is of type B_m with $m \geq 2$.

Note that for any $\beta \in \Xi \setminus \Xi^L$, there exists $\beta_1, \beta_2 \in \Xi^L$ such that $\beta = \frac{1}{2}(\beta_1 + \beta_2)$ and $(\beta_1 | \beta_2) = 0$. Hence $\iota \in \text{Hom}(\Xi, \Sigma)$ is determined by $\iota|_{\Xi^L}$. Note that Ξ^L is of type D_m with $D_2 \simeq 2A_1$ and $D_3 \simeq A_3$.

Then $\text{Hom}(\Xi, \Sigma) \neq \emptyset$ means Σ is of type B_n ($n \geq m$) or F_4 if $m > 2$.

If $m > 2$ or if Σ is of type F_4 , $\#\overline{\text{Hom}}(\Xi^L, \Sigma) = 1$ and therefore $\#\overline{\text{Hom}}(\Xi, \Sigma) = 1$. If $m = 2$ and $\Sigma = B_n$ or C_n , it is easy to see that

$$\left\{ \iota \in \text{Hom}(2A_1, \Sigma); \frac{1}{2}(\iota(\beta_1) + \iota(\beta_2)) \in \Sigma \right\}$$

is a single W_Σ -orbit and we have also $\#\overline{\text{Hom}}(\Xi, \Sigma) = 1$. Here $\Xi^L = \langle \beta_1 \rangle + \langle \beta_2 \rangle \simeq 2A_1$.

4) When Σ is of type C_n , we have the theorem from the case 3) by considering the dual root systems Ξ^\vee and Σ^\vee .

5) We first examine $\overline{\text{Hom}}(E_6, E_8)$ and $\overline{\text{Hom}}(E_7, E_8)$ under the notation in §9.

Since $\#\overline{\text{Hom}}(A_5, E_8) = \#\overline{\text{Hom}}(A_6, E_8) = 1$, we may assume

$$E_6^o \supset \Psi_{A_5} = \{\alpha_0 = -\epsilon_7 - \epsilon_8, \alpha_8 = \epsilon_7 - \epsilon_6, \alpha_7 = \epsilon_6 - \epsilon_5, \alpha_6 = \epsilon_5 - \epsilon_4, \alpha_5 = \epsilon_4 - \epsilon_3\}$$

for the imbedding $E_6 \simeq E_6^o \subset E_8$. Let $\tilde{\alpha} \in \Phi \setminus \Psi_{A_5}$. We have

$$\tilde{\alpha} = \sum_{j=1}^8 c_j \epsilon_j \in E_6^o \subset E_8 : \langle \tilde{\alpha}, \alpha_j \rangle = \begin{cases} 0 & (j = 0, 8, 6, 5), \\ -1 & (j = 7). \end{cases}$$

Thus

$$\tilde{\alpha} = c_1\epsilon_1 + c_2\epsilon_2 + c(\epsilon_3 + \epsilon_4 + \epsilon_5) + (c-1)(\epsilon_6 + \epsilon_7 - \epsilon_8).$$

Since $\tilde{\alpha}$ is a root of E_8 , we have $c = \frac{1}{2}$ and hence

$$\tilde{\alpha} = \alpha_{\pm} := \frac{1}{2}(\pm(\epsilon_1 + \epsilon_2) + \epsilon_3 + \epsilon_4 + \epsilon_5 - \epsilon_6 - \epsilon_7 + \epsilon_8).$$

Since $\alpha_2 = \epsilon_1 + \epsilon_2$ is orthogonal to α_j ($j = 0, 5, 6, 7, 8$) and $s_{\alpha_2}\alpha_+ = \alpha_-$, we have $\#\overline{\text{Hom}}(E_6, E_8) = 1$ and

$$\begin{aligned} (E_6^o)^\perp \cap E_8 &\simeq \Psi_{A_5}^\perp \cap \alpha_+^\perp \cap E_8 \\ &= (\langle \alpha_1, \alpha_3 \rangle + \langle \alpha_2 \rangle) \cap \alpha_+^\perp \\ &= \langle \alpha_1, \alpha_3 \rangle \simeq A_2. \end{aligned} \quad \begin{array}{cccccccc} \alpha_1 & \alpha_3 & \alpha_4 & \alpha_5 & \alpha_6 & \alpha_7 & \alpha_8 & \alpha_0 \\ * & * & * & * & * & * & * & * \\ & & \vdots & & & & & \\ & & * & \alpha_2 & & & & \\ & & & \vdots & & & & \\ & & & & & & \circ & \tilde{\alpha} \\ & & & & & & & \circ \end{array}$$

Let $E_7 \simeq E_7^o \subset E_8$. Then we may moreover assume $\alpha_4 = \epsilon_3 - \epsilon_2 \in E_7$ and the condition $\tilde{\alpha} \perp \alpha_4$ implies $\tilde{\alpha} = \alpha_+$. Hence $\#\overline{\text{Hom}}(E_7, E_8) = 1$ and

$$(E_7^o)^\perp \cap E_8 \simeq \langle \alpha_1, \alpha_3 \rangle \cap \alpha_4^\perp = \langle \alpha_1 \rangle \simeq A_1.$$

Now we examine $\overline{\text{Hom}}(E_6, E_7)$. Since $A_5 \subset E_6 \simeq E_6^o \subset E_7$, the argument in 1) assures that we may assume

$$\begin{aligned} E_6^o \supset \Psi'_{A_5} &:= \Psi_{A_4} \cup \{\alpha_2 = \epsilon_1 + \epsilon_2\} \text{ or } E_6^o \supset \Psi_{A_5} := \Psi_{A_4} \cup \{\alpha_5 = \epsilon_4 - \epsilon_3\} \\ \Psi_{A_4} &:= \{\alpha_0 = \epsilon_8 - \epsilon_7, \alpha_1 = \frac{1}{2}(\epsilon_1 - \epsilon_2 - \epsilon_3 - \epsilon_4 - \epsilon_5 - \epsilon_6 - \epsilon_7 + \epsilon_8), \\ &\quad \alpha_3 = \epsilon_2 - \epsilon_1, \alpha_4 = \epsilon_3 - \epsilon_2\}. \end{aligned}$$

Then there exists $\tilde{\alpha} = \sum_{j=1}^8 c_j \epsilon_j \in E_6^o \subset E_7$ such that

$$\begin{aligned} (\tilde{\alpha}|\alpha_j) &= 0 \quad (j = 0, 1, 4), \\ (\tilde{\alpha}|\alpha_3) &= -1, \\ (\tilde{\alpha}|\alpha_2)(\tilde{\alpha}|\alpha_5) &= 0. \end{aligned} \quad \begin{array}{cccccccc} \alpha_0 & \alpha_1 & \alpha_3 & \alpha_4 & \alpha_5 & \alpha_6 & \alpha_7 \\ \circ & * & * & * & * & * & * \\ & & & \vdots & & & \\ & & & \circ & \tilde{\alpha} & \circ & \alpha_2 \\ & & & & & & \end{array}$$

Then the condition $(\tilde{\alpha}|\alpha_0) = 0$ implies $c_7 = c_8 = 0$ and

$$\begin{aligned} \tilde{\alpha} &= (c+1)\epsilon_1 + c(\epsilon_2 + \epsilon_3) + c_4\epsilon_4 + c_5\epsilon_5 + c_6\epsilon_6, \\ 1 - c - c_4 - c_5 - c_6 &= 0, \\ (2c+1)(c - c_4) &= 0. \end{aligned}$$

Hence $c = 0$, $E_6^0 \supset \Psi_{A_5}$ and $\tilde{\alpha} = \epsilon_1 + \epsilon_5$ or $\epsilon_1 + \epsilon_6$. Since

$$\Psi_{A_5}^\perp \cap E_7 = \langle \alpha_7 \rangle = \langle \epsilon_6 - \epsilon_5 \rangle$$

and $s_{\epsilon_6 - \epsilon_5}(\epsilon_1 + \epsilon_5) = \epsilon_1 + \epsilon_6$, we have $\#\overline{\text{Hom}}(\Xi, \Sigma) = 1$ and $(E_6^o)^\perp \cap E_7 = \emptyset$.

If $\#\text{Hom}(\Xi, \Sigma) = 1$, any element of $\text{Hom}(\Xi, \Sigma)$ is isomorphic to the imbedding ι corresponding to the graphic imbedding $\bar{\iota}$ given in the claim. Since $\iota(\Xi)^\perp \supset \langle \Psi \cap \bar{\iota}(\Xi)^\perp \rangle$ and $\iota(\Xi)^\perp \simeq \langle \Psi \cap \bar{\iota}(\Xi)^\perp \rangle$, we have $\iota(\Xi)^\perp = \langle \Psi \cap \bar{\iota}(\Xi)^\perp \rangle$.

6) If Ξ is of type G_2 or F_4 , the theorem is clear and thus we have completed the proof of the theorem.

6. DUAL PAIRS AND CLOSURES

Definition 6.1. For a subsystem Ξ of a root system Σ and a subgroup G of $\text{Aut}(\Sigma)$ we put

$$(6.1) \quad N_G(\Xi) := \{g \in G; g(\Xi) = \Xi\}, \quad Z_G(\Xi) := \{g \in G; g|_\Xi = id\},$$

$$(6.2) \quad \text{Aut}_\Sigma(\Xi) := N_{W_\Sigma}(\Xi)/Z_{W_\Sigma}(\Xi) \subset \text{Aut}(\Xi),$$

$$(6.3) \quad \text{Out}_\Sigma(\Xi) := \text{Aut}_\Sigma(\Xi)/W_\Xi \simeq N_{W_\Sigma}(\Xi)/(W_\Xi \times W_{\Xi^\perp}) \subset \text{Out}(\Xi).$$

Note that the isomorphism in (6.3) follows from the equality $Z_{W_\Sigma}(\Xi) = W_{\Xi^\perp}$.

Proposition 6.2. *Let Ξ_1 be a subsystem of Σ . Put $\Xi_2 = \Xi_1^\perp$. Then there is a homomorphism*

$$(6.4) \quad \varpi : \text{Out}_\Sigma(\Xi_1) \rightarrow \text{Out}_\Sigma(\Xi_2) \simeq \text{Out}_\Sigma(\Xi_2^\perp)$$

and

$$(6.5) \quad \varpi \text{ is bijective if } \Xi_2^\perp = \Xi_1,$$

$$(6.6) \quad \text{Out}_\Sigma(\Xi_1) \xrightarrow{\sim} \text{Out}(\Xi_1) \text{ if } \#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) = \#\overline{\text{Hom}}(\Xi_1, \Sigma),$$

$$(6.7) \quad \text{Out}_\Sigma(\Xi_2) \xrightarrow{\sim} \text{Out}(\Xi_2) \text{ if } \#(\overline{\text{Hom}}(\Xi_2, \Sigma)/\text{Out}(\Xi_2)) = \#\overline{\text{Hom}}(\Xi_2, \Sigma).$$

Proof. Since $N_{W_\Sigma}(\Xi_1) \subset N_{W_\Sigma}(\Xi_2)$ and $\Xi_2^\perp \supset \Xi_1$, (6.4) is well-defined and (6.5) is clear. Suppose $\#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) = \#\overline{\text{Hom}}(\Xi_1, \Sigma)$. Then for any $g \in \text{Aut}(\Xi_1)$ there exists $w \in W_\Sigma$ with $w|_{\Xi_1} = g|_{\Xi_1}$ and (6.6) is clear. We have also (6.7). The isomorphism in (6.4) follows from the following definition. \square

Definition 6.3 (dual pairs). A pair (Ξ_1, Ξ_2) of subsystems of a root system Σ is called a *dual pair* in Σ if

$$(6.8) \quad \Xi_1^\perp = \Xi_2 \quad \text{and} \quad \Xi_2^\perp = \Xi_1.$$

If (Ξ_1, Ξ_2) is a dual pair, the map ϖ in Proposition 6.2 is an isomorphism. The dual pair is called *special* if the map ϖ is the isomorphism

$$(6.9) \quad \varpi : \text{Out}(\Sigma_1) \xrightarrow{\sim} \text{Out}(\Sigma_2).$$

For a subsystem Ξ of Σ , its \perp -closure $\overline{\Xi}$ is defined by $\overline{\Xi} := (\Xi^\perp)^\perp$. Then (Ξ, Ξ^\perp) is a dual pair if and only if Ξ is \perp -closed (i.e. $(\Xi^\perp)^\perp = \Xi$) and hence $(\overline{\Xi}, \overline{\Xi}^\perp)$ is always a dual pair. We say that Ξ is \perp -dense in Σ if $\Xi^\perp = \emptyset$.

Corollary 6.4. *Let (Ξ_1, Ξ_2) be a dual pair in Σ . Then*

$$(6.10) \quad \text{Out}(\Xi_1) \not\cong \text{Out}(\Xi_2) \Rightarrow \begin{cases} \#(\text{Hom}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) < \#\overline{\text{Hom}}(\Xi_1, \Sigma) \\ \text{or} \\ \#(\text{Hom}(\Xi_2, \Sigma)/\text{Out}(\Xi_2)) < \#\overline{\text{Hom}}(\Xi_2, \Sigma). \end{cases}$$

Suppose $\#\overline{\text{Hom}}(\Xi_2, \Sigma) = 1$. Let $\iota \in \text{Hom}(\Xi_1, \Sigma)$. Then we have

$$(6.11) \quad (\Xi_1, \Xi_2) \text{ is a special dual pair} \Leftrightarrow \#\text{Out}(\Xi_1) = \#\text{Out}(\Xi_2),$$

$$(6.12) \quad \exists w \in W_\Sigma \text{ such that } \iota(\Xi_1) = w(\Xi_1) \Leftrightarrow \iota(\Xi_1)^\perp \simeq \Xi_2.$$

Proof. Note that (6.10) is the direct consequence of Proposition 6.2.

Suppose $\#\overline{\text{Hom}}(\Xi_2, \Sigma) = 1$. Then Proposition 6.2 implies

$$\text{Out}(\Xi_1) \supset \text{Out}_\Sigma(\Xi_1) \xrightarrow{\sim} \text{Out}(\Xi_2)$$

and (6.11) is clear. Then if $\iota(\Xi_1)^\perp \simeq \Xi_2$, there exists $w \in W_\Sigma$ with $\iota(\Xi_1^\perp) = w(\Xi_2)$ and therefore $\iota(\Xi_1) = w(\Xi_1)$, which implies the claim. \square

Example 6.5. i) The followings are examples of the triplets (Σ, Ξ_1, Ξ_2) such that (Ξ_1, Ξ_2) are special dual pairs in Σ .

$$\begin{aligned} & (D_{m+n}, D_m, D_n) \quad (m \geq 2, n \geq 2, m \neq 4, n \neq 4), \\ & (E_6, A_3, 2A_1), (E_7, A_5, A_2), (E_7, A_3 + A_1, A_3), (E_7, 3A_1, D_4), \\ & (E_8, E_6, A_2), (E_8, A_5, A_2 + A_1), (E_8, A_4, A_4), (E_8, D_6, 2A_1), (E_8, D_5, A_3), \\ & (E_8, D_4, D_4), (E_8, D_4 + A_1, 3A_1), (E_8, 2A_2, 2A_2), \\ & (E_8, A_3 + A_1, A_3 + A_1), (E_8, 4A_1, 4A_1), (F_4, A_2, A_2). \end{aligned}$$

In these examples except for $(D_4, 2A_1, 2A_1)$ and $(E_8, 4A_1, 4A_1)$, $\#\overline{\text{Hom}}(\Xi_2, \Sigma) = 1$ and the triplet is uniquely determined by the data (Σ, Ξ_1, Ξ_2) up to the automorphisms defined by W_Σ . If the imbedding $4A_1 \subset E_8$ satisfies $(4A)^\perp \simeq 4A_1$, we have a special dual pair (A_4, A_4) in E_8 , which is also uniquely defined. The imbedding $2A_1 \subset D_4$ is unique up to $\text{Aut}(D_4)$.

ii) The isomorphism $\varpi \in \text{Out}(2A_2)$ defined by the dual pair $(2A_2, 2A_2)$ in E_8 satisfies

$$(6.13) \quad \varpi(\text{Out}(A_2) \times \text{Out}(A_2)) \neq \text{Out}(A_2) \times \text{Out}(A_2)$$

because $\#(\overline{\text{Hom}}(4A_2, E_8)/\text{Out}'(4A_2)) = \#\overline{\text{Hom}}(2A_2, E_8) = 1$. See §8.2.5.

iii) For example, if (Σ, Ξ_1, Ξ_2) is (E_6, A_5, A_1) or (E_7, D_6, A_1) , (Ξ_1, Ξ_2) is a dual pair in Σ satisfying $\text{Out}(\Xi_1) \not\cong \text{Out}(\Xi_2)$ and $\#\overline{\text{Hom}}(\Xi_2, \Sigma) = 1$, which implies $\#\overline{\text{Hom}}(\Xi_1, \Sigma) > 1$.

Definition 6.6 (*S-closure*). A subsystem Ξ of Σ is *S-closed* if and only if

$$(6.14) \quad \alpha, \beta \in \Xi \text{ and } \alpha + \beta \in \Sigma \Rightarrow \alpha + \beta \in \Xi.$$

Remark 6.7. i) Let \mathfrak{g} be a complex semisimple Lie algebra with the root system Σ and let X_α be root vectors corresponding to $\alpha \in \Sigma$. Then the root system of the semisimple Lie algebra \mathfrak{g}_Ξ generated by $\{X_\alpha; \alpha \in \Xi\}$ is the *S-closure* of Ξ .

Let Ξ_1 and Ξ_2 be *S-closed* subsystems of Σ . Then

$$(6.15) \quad [\mathfrak{g}_{\Xi_1}, \mathfrak{g}_{\Xi_2}] = 0 \Leftrightarrow \Xi_1 \perp \Xi_2.$$

Hence if (Ξ_1, Ξ_2) is a dual pair with $\text{rank } \Xi_1 + \text{rank } \Xi_2 = \text{rank } \Sigma$, the dual pair of root systems gives a dual pair in semisimple Lie algebras (cf. [Ru]).

ii) Suppose Σ is irreducible and there exist $\alpha, \beta \in \Sigma$ with $\alpha + \beta \in \Sigma \setminus \Xi$. Then $\alpha \perp \beta$ and $\langle \alpha, \beta, \alpha + \beta \rangle$ is of type B_2 , which implies that Σ is of type B_n or C_n or F_4 . For example, $D_n \subset C_n$ is not *S-closed* and the *S-closure* of D_n equals C_n ($n \geq 2$).

iii) If Ξ is a fundamental subsystem, then

$$\Xi \underset{\Sigma}{\sim} \Sigma \cap \sum_{\alpha \in \Theta} \mathbb{R}\alpha$$

for a subset $\Theta \subset \Psi$ and hence Ξ is *S-closed*. If $\Xi = (\Xi^\perp)^\perp$, then Ξ is *S-closed*.

7. MAKING TABLES

We are ready to answer the questions in the introduction by completing the tables in §10. In this section we do it when the root system Σ is of the exceptional type. Following the argument in §3, we easily get all Ξ satisfying $\text{Hom}(\Xi, \Sigma) \neq \emptyset$ together with $\#\overline{\text{Hom}}(\Xi, \Sigma)$ and Ξ^\perp by Theorem 3.3. In fact, we start from the irreducible Ξ and then examine other Ξ by using (3.2) in a suitable lexicographic order (as in the table) to avoid confusion (cf. Example 3.5 x)).

As a result we finally get $(\Xi^\perp)^\perp$ and the dual pairs. Moreover (6.11) tells us whether the dual pair is special or not. We will calculate $\#\{\Theta \subset \Phi; \langle \Theta \rangle \simeq \Xi\}$ in §7.5.

Now we prepare the lemma to examine the action of W_Σ on the imbeddings of a root system Ξ into Σ .

Lemma 7.1. *Let Ξ_1 and Ξ_2 be subsystems of Σ with $\Xi_2 \subset \Xi_1^\perp$. Then*

$$(7.1) \quad \begin{aligned} \#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) &= \#(\text{Hom}(\Xi_2, \Xi_1^\perp)/\text{Out}(\Xi_2)) = 1 \\ &\Rightarrow \#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}(\Xi_1 + \Xi_2)) = 1, \end{aligned}$$

$$(7.2) \quad \begin{aligned} \#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}'(\Xi_1)) &= \#(\overline{\text{Hom}}(\Xi_2, \Xi_1^\perp)/\text{Out}'(\Xi_2)) = 1 \\ &\Rightarrow \#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}'(\Xi_1 + \Xi_2)) = 1, \end{aligned}$$

$$(7.3) \quad \begin{cases} \#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) = \#(\text{Out}(\Xi_1^\perp) \backslash \overline{\text{Hom}}(\Xi_2, \Xi_1^\perp)/\text{Out}'(\Xi_2)) \\ \quad = 1 \\ \text{Out}'(\Xi_1) \simeq \text{Out}(\Xi_1) \text{ and } (\Xi_1, \Xi_1^\perp) \text{ is a special dual pair} \\ \Rightarrow \#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}'(\Xi_1 + \Xi_2)) = 1, \end{cases}$$

$$(7.4) \quad \begin{cases} \#(\overline{\text{Hom}}(\Xi_1, \Sigma)/\text{Out}(\Xi_1)) = \#(\overline{\text{Hom}}(\Xi_2, \Xi_1^\perp)/\text{Out}(\Xi_2)) = 1 \\ \text{and } \iota(\Xi_2)^\perp \simeq \Xi_1 \ (\forall \iota \in \text{Hom}(\Xi_2, \Sigma)) \Rightarrow \#(\overline{\text{Hom}}(\Xi_2, \Sigma)/\text{Out}(\Xi_2)) = 1. \end{cases}$$

Proof. The claims (7.1) and (7.2) are clear because for $\iota \in \text{Hom}(\Xi_1 + \Xi_2, \Sigma)$ the assumptions assure that there exists $w \in W_\Sigma$ such that $\iota(\Xi_1) = w(\Xi_1)$ and hence we may assume $\iota(\Xi_1) = \Xi_1$ in $\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)$. Under the assumption in (7.3) there exists $w \in W_\Sigma$ such that $w \circ \iota$ stabilizes every irreducible component of Ξ_2 and therefore it also stabilizes Ξ_1 and we have (7.3).

The claim (7.4) is also clear because for $\iota \in \text{Hom}(\Xi_2, \Sigma)$, $\exists w \in W_\Sigma$ such that $w \circ \iota(\Xi_2)^\perp = \Xi_1$, which implies $w \circ \iota(\Xi_2) \subset \Xi_1^\perp$. \square

7.1. Type E_6 . The automorphism group of $G(\tilde{\Psi})$ is of order 6, which is generated by a rotation and a reflection. Since the rotation has order 3, it corresponds to an element of W_{E_6} and the reflection corresponds to a non-trivial element of $\text{Out}(E_6)$.

The set $\overline{\text{Hom}}(A_4, E_6)$ has two elements which are shown in Example 3.5 v). It also shows that $\text{Out}(E_6)$ non-trivially acts on this set. If A_4 is imbedded to E_6 given as in the above imbedding $G(A_4) \subset G(\tilde{E}_6)$ with the starting vertex $\{\alpha_0\}$, the non-trivial action by $\text{Out}(A_4)$ changes the starting vertex as is shown above. Then by an element of W_{A_5} with $A_5 = \langle \alpha_0, \alpha_2, \alpha_1, \alpha_5, \alpha_6 \rangle$ the imbedding is transformed as is shown by the second arrow. Then the result corresponds to a reflection, which implies that $\text{Out}(A_4)$ also acts non-trivially on $\overline{\text{Hom}}(A_4, E_6)$ and hence $\#(\overline{\text{Hom}}(A_4, E_6)/\text{Out}(A_4)) = 1$.

The same argument works for $\Xi = A_5, A_2 + A_1$ and $A_3 + A_1$. Similarly $(\alpha_2, \alpha_0, \alpha_5, \alpha_6)$ is transformed to $(\alpha_6, \alpha_5, \alpha_0, \alpha_2)$ by an element of W_{A_5} and furthermore to $(\alpha_0, \alpha_2, \alpha_4, \alpha_3)$ by a rotation. Hence a non-trivial element of $\text{Out}(A_2)$ for $A_2 = \langle \alpha_0, \alpha_2 \rangle$ induces the transposition of two irreducible components of $A_2^\perp \simeq A_2 + A_2$, which implies $\#(\overline{\text{Hom}}(2A_2, E_6)/\text{Out}'(2A_2)) = 1$.

From our construction of the representatives of $\overline{\text{Hom}}(\Xi, E_6)$ it is obvious to have $\#(\overline{\text{Hom}}(\Xi, E_6)/\text{Out}'(\Xi)) = 1$ for $\Xi = D_5$ (cf. (5.3)) and E_6 and we can easily calculate $\#(\text{Out}(E_6) \backslash \overline{\text{Hom}}(\Xi, E_6))$. Put $\Sigma = E_6$ and let (Ξ_1, Ξ_2) be any one of the pairs $(A_2 + A_1, A_1)$, $(2A_2, A_1)$, $(2A_2, A_2)$, $(2A_1, A_3)$, (A_4, A_1) and (A_5, A_1) . Then applying (7.2) to Σ and (Ξ_1, Ξ_2) , we have $\#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}'(\Xi_1 + \Xi_2)) = 1$.

7.2. Type E_7 . Note that $G(\tilde{E}_7)$ has an automorphism of order 2 and it corresponds to an element of W_{E_7} because $W_{E_7} = \text{Aut}(E_7)$.

Let $\Sigma = E_7$ and let (Ξ_1, Ξ_2) be any one of (A_1, D_6) , (A_2, A_2) , $(A_2, A_2 + A_1)$, (A_2, A_3) , $(A_2, A_3 + A_1)$, (A_3, A_3) and $(A_3, A_3 + A_1)$. We have $\#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}'(\Xi_1 + \Xi_2)) = 1$ by (7.2). Here we note that $A_1^\perp \simeq D_6$, $A_2^\perp \simeq A_5$ and $A_3^\perp \simeq A_3 + A_1$. We can apply (7.3) to $(\Xi_1, \Xi_2) = (D_4, kA_1)$ with $1 \leq k \leq 3$ and we have the same conclusion. Applying (7.1) to $(A_3, 3A_1)$, we have $\#(\overline{\text{Hom}}(A_3 + 3A_1, E_7)/\text{Out}(A_3 + 3A_1)) = 1$.

The subsystems Ξ of E_7 which are isomorphic to $3A_1$ and satisfy $\Xi^\perp \simeq 4A_1$ are mutually equivalent by Σ . Hence $\Xi^\perp \simeq 4A_1$ also have this property. Namely

$$\#(W_{E_7} \setminus \{\iota \in \text{Hom}(4A_1, E_7); (\iota(4A_1)^\perp)^\perp = \iota(4A_1)\} / \text{Aut}(4A_1)) = 1.$$

Put $(A_1)_o = \langle \alpha_0 \rangle$. We have $G(\widetilde{(A_1)_o^\perp})$ as is given in the following first diagram. Put $(2A_1)_o = \langle \alpha_0, \alpha_p \rangle$. Then the extended Dynkin diagrams of the components of $(2A_1)_o^\perp = \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_7 \rangle \simeq D_4 + A_1$ are also given by the following second diagram. These diagrams correspond to the last figure in Remark 3.7 i). Here we put

$$\begin{aligned} -\alpha_p &= (\alpha_2 + \alpha_3 + \cdots + \alpha_7) + (\alpha_4 + \alpha_5 + \alpha_6) = \epsilon_5 + \epsilon_6, \\ -\alpha_q &= \alpha_2 + \alpha_3 + 2\alpha_4 + \alpha_5 = \epsilon_3 + \epsilon_4. \end{aligned}$$

In the above diagrams the vertices expressed by asterisks are considered to be removed and the diagrams are (extended) Dynkin diagrams for other roots.

There are two equivalence classes in the imbeddings of $3A_1$ to E_7 , whose representatives are

$$(3A_1)_1 = \langle \alpha_0, \alpha_p, \alpha_q \rangle, \quad (3A_1)_2 = \langle \alpha_0, \alpha_p, \alpha_7 \rangle,$$

which satisfy

$$(3A_1)_1^\perp = \langle \alpha_2, \alpha_3, \alpha_5, \alpha_7 \rangle \simeq 4A_1, \quad (3A_1)_2^\perp = \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5 \rangle \simeq D_4.$$

Thus the image of the imbedding of $4A_1$ to E_7 is equivalent to one of the following subsystems $(4A_1)_j$ of E_7 :

$$\begin{aligned} (4A_1)_1 &= \langle \alpha_0, \alpha_p, \alpha_q, \alpha_7 \rangle, & (4A_1)_1^\perp &= \langle \alpha_2, \alpha_3, \alpha_5 \rangle, \\ (4A_1)_2 &= \langle \alpha_0, \alpha_p, \alpha_q, \alpha_5 \rangle, & (4A_1)_2^\perp &= \langle \alpha_2, \alpha_3, \alpha_7 \rangle, \\ (4A_1)_3 &= \langle \alpha_0, \alpha_p, \alpha_q, \alpha_2 \rangle, & (4A_1)_3^\perp &= \langle \alpha_3, \alpha_5, \alpha_7 \rangle, \\ (4A_1)_4 &= \langle \alpha_0, \alpha_p, \alpha_q, \alpha_3 \rangle, & (4A_1)_4^\perp &= \langle \alpha_2, \alpha_5, \alpha_7 \rangle. \end{aligned}$$

In view of Remark 3.4 ii) the above procedures for $3A_1 \subset E_6$ can be also explained by the following isomorphic ones.

Here $\alpha_r = -\alpha_p$ and $\alpha_s = -\alpha_q$. In fact $\alpha_p, \alpha_r \in \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_7 \rangle^\perp = (D_4 + A_1)^\perp \simeq A_1$. As $m_7(\alpha_p) < 0$ and $m_7(\alpha_r) > 0$, we have $\alpha_r = -\alpha_p$. Similarly we have $\alpha_s = -\alpha_q$ from $\alpha_q, \alpha_s \in \langle \alpha_0, \alpha_2, \alpha_3, \alpha_5, \alpha_7, \alpha_p \rangle^\perp \simeq A_1$. This is also easily verified by the Dynkin diagrams with the coefficients $m_j(-\alpha_0)$ in §9.

Note that

$$\langle \alpha_2, \alpha_3, \alpha_5 \rangle \underset{\langle \alpha_5, \alpha_6, \alpha_7 \rangle}{\sim} \langle \alpha_2, \alpha_3, \alpha_7 \rangle \underset{\langle \alpha_1, \alpha_2, \alpha_3, \alpha_4 \rangle}{\sim} \langle \alpha_1, \alpha_4, \alpha_7 \rangle \underset{\langle \alpha_1, \alpha_3, \dots, \alpha_7 \rangle}{\sim} \langle \alpha_3, \alpha_5, \alpha_7 \rangle.$$

Thus we can conclude

$$(7.5) \quad ((4A_1)_j^\perp)^\perp \begin{cases} \simeq \langle \alpha_3, \alpha_5, \alpha_7 \rangle^\perp = \langle \alpha_0, \alpha_2, \alpha_r, \alpha_s \rangle \simeq 4A_1 & (j = 1, 2, 3), \\ = \langle \alpha_0, \alpha_1, \alpha_3, \alpha_r, \alpha_s \rangle \simeq D_4 & (j = 4). \end{cases}$$

Since $(4A_1)_j^\perp$ for $j = 1, 2, 3$ are equivalent to each other by E_8 , so are the subsystems $(4A_1)_j = ((4A_1)_j^\perp)^\perp$ for $j = 1, 2, 3$. Moreover we have

$$(7.6) \quad \langle \alpha_0, \alpha_p, \alpha_q, \alpha_3 \rangle \underset{\langle \alpha_2, \alpha_3, \dots, \alpha_7 \rangle}{\sim} \langle \alpha_0, \alpha_2, \alpha_q, \alpha_7 \rangle \underset{\langle \alpha_2, \alpha_3, \alpha_4, \alpha_5 \rangle}{\sim} \langle \alpha_0, \alpha_3, \alpha_5, \alpha_7 \rangle.$$

Put $P_\Xi = \{\Theta \subset \Psi; \langle \Theta \rangle \simeq \Xi\}$. It is easy to see that if $\Theta \in P_{3A_1}$ satisfies $\Theta \cap \{\alpha_1, \alpha_3\} \neq \emptyset$, $\langle \Theta \rangle \underset{E_7}{\sim} (3A_1)_1$. Moreover if $\Theta \in P_{3A_1}$ satisfies $\Theta \cap \{\alpha_1, \alpha_3\} = \emptyset$,

then $\Theta = \{\alpha_2, \alpha_5, \alpha_7\}$. We will have $\#B_{3A_1} = 11$ in §7.5.

Applying (7.4) to $(\Xi_1, \Xi_2) = (2A_1, 5A_1)$ and $(A_1, 6A_1)$ with $\Sigma = E_7$, we have $\#(\overline{\text{Hom}}(\Xi_2, \Sigma)/\text{Out}(\Xi_2)) = 1$, respectively. Similarly applying (7.1) to $(\Xi_1, \Xi_2) = (5A_1, A_1)$ and $(5A_1, 2A_1)$, we have $\#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, \Sigma)/\text{Out}(\Xi_1 + \Xi_2)) = 1$, respectively.

7.3. Type E_8 . Applying (7.4) to $(3A_1, 5A_1)$ and then (7.1) to $(5A_1, A_1)$, $(5A_1, 2A_1)$ and $(5A_1, 3A_1)$, respectively, we have $\#(\overline{\text{Hom}}(kA_1, E_8)/\text{Out}(kA_1)) = 1$ for $k = 5, 6, 7$ and 8 . See §8.2.3 to get further results on $\text{Hom}(kA_1, E_8)$ with $1 \leq k \leq 8$.

If (Ξ_1, Ξ_1^\perp) is any one of the pairs (A_2, E_6) , (A_4, A_4) , (D_4, D_4) , (D_5, A_3) and (D_6, A_1) , we have

$$\text{Hom}(\Xi_2, \Xi_1^\perp) \neq \emptyset \Rightarrow \#(\overline{\text{Hom}}(\Xi_1 + \Xi_2, E_8)/\text{Out}'(\Xi_1 + \Xi_2)) = 1$$

by applying (7.3). Hence if Ξ contains A_2, A_4, D_4, D_5 or D_6 as an irreducible component, the value of the column indicated by $\#_{\Xi'}$ equals one. Moreover (7.1) can be applied to $(\Xi_1, \Xi_2) = (A_3, 3A_1)$, $(A_3, 4A_1)$ and $(A_5, 2A_1)$. The number $\#(\overline{\text{Hom}}(\Xi, E_8)/\text{Out}'(\Xi))$ for $\Xi = A_3 + 3A_1, A_3 + 4A_1$ and $A_5 + 2A_1$ is easily obtained from $(A_3 + A_1)^\perp \simeq A_3 + A_1$ and $A_5^\perp \simeq A_2 + A_1$.

Put

$$\begin{aligned} (A_7)_o &= \langle \alpha_1, \alpha_3, \dots, \alpha_8 \rangle \subset (A_8)_o = \langle (A_7)_o, \alpha_0 \rangle, \\ (D_6)_o &= \{\pm \epsilon_i \pm \epsilon_j; 3 \leq i < j \leq 8\} = \{\alpha_2, \alpha_3\}^\perp, \\ P_\Xi &= \{\Theta \subset \{\alpha_1, \dots, \alpha_8\}; \langle \Theta \rangle \simeq \Xi\}. \end{aligned}$$

Then we note the following for $\Theta_1, \Theta_2 \in P_\Xi$.

$\Theta_1 \underset{\Sigma}{\sim} \Theta_2$ if $\Theta_j \subset (A_8)_o$ for $j = 1, 2$ and $\Theta_1 \simeq \Theta_2$.

If $\Theta_1 \ni \{\alpha_2, \alpha_3\}$, then $\Theta_1^\perp = \Theta_1^\perp \cap (D_6)_o$.

Using these facts, we can easily examine P_Ξ . For example, any $\Theta \in P_{4A_1}$ satisfies $\langle \Theta \rangle \underset{E_8}{\sim} (4A_1)_o := \langle \alpha_2, \alpha_3, \alpha_6, \alpha_8 \rangle$. Here $(4A_1)_o^\perp = \langle \alpha_6, \alpha_8 \rangle^\perp \cap D_6 \simeq 4A_1$.

7.4. Type F_4 and G_2 . It is easy to examine the cases when $\Sigma = F_4$ and G_2 by using Theorem 3.3 together with Remark 3.1, (2.38) and (5.4).

7.5. Fundamental subsystems. We will give the number of the elements $P_\Xi := \{\Theta \subset \Psi; \langle \Theta \rangle \simeq \Xi\}$ for a subsystem Ξ of Σ when Σ is of the exceptional type. If $\#\Theta = \#\Psi - 1$, it is easy to specify Ξ that is isomorphic to $\langle \Theta \rangle$ and we get the corresponding $\#P_\Xi$. Other $\langle \Theta \rangle$ are fundamental subsystems of these maximal ones and hence it is also easy to know whether $P_\Xi = \emptyset$ or not. Note that $\text{rank}(\Theta) = \#\Theta$.

The number $\#P_\Xi$ can be inductively calculated as follows. Let denote the number by $[\Xi, \Sigma]$. For simplicity $\sum_j m_j A_j$ may be denoted $1^{m_1} \cdot 2^{m_2} \dots$ with omitting the terms satisfying $m_j = 0$.

If Σ is of type E_n , we divide P_Ξ into the subsets according to the relation with the end root α_n . For example, suppose $\Sigma = E_6$ and $\Theta \subset \Psi$ satisfies $\langle \Theta \rangle \simeq 2A_1$.

Then if $\alpha_6 \in \Theta$, one component of Θ is in $\alpha_6^\perp \simeq A_4$. If $\alpha_6 \notin \Theta$, Θ is contained in $\Psi \setminus \{\alpha_6\} \simeq D_5$. Thus we have $[1^2, E_6] = [1, A_4] + [1^2, D_5]$. Now it is quite easy to have $[1, A_4] = 4$ and $[1^2, D_5] = 6$. We will show such calculations except for quite easy cases.

$$\begin{aligned}
[1^2, E_6] &= [1, A_4] + [1^2, D_5] = 4 + 6 = 10, \\
[1^2, E_7] &= [1, D_5] + [1^2, E_6] = 5 + 10 = 15, \\
[1^2, E_8] &= [1, E_6] + [1^2, E_7] = 6 + 15 = 21, \\
[1^3, E_6] &= [1^2, A_4] + [1^3, D_5] = 3 + 2 = 5, \\
[1^3, E_7] &= [1^2, D_5] + [1^3, E_6] = 6 + 5 = 11, \\
[1^3, E_8] &= [1^2, E_6] + [1^3, E_7] = 10 + 11 = 21, \\
[1^4, E_7] &= [1^3, D_5] + [1^4, E_6] = 2 + 0 = 2, \\
[1^4, E_8] &= [1^3, E_6] + [1^4, E_7] = 5 + 2 = 7, \\
[2 \cdot 1, E_6] &= [1, A_2 + A_1] + [2, A_4] + [2 \cdot 1, D_5] = 3 + 3 + 4 = 10, \\
[2 \cdot 1, E_7] &= [1, A_4] + [2, D_5] + [2 \cdot 1, E_6] = 4 + 4 + 10 = 18, \\
[2 \cdot 1, E_8] &= [1, D_5] + [2, E_6] + [2 \cdot 1, E_7] = 5 + 5 + 18 = 28, \\
[2 \cdot 1^2, E_7] &= [1^2, A_4] + [2 \cdot 1, D_5] + [2 \cdot 1^2, E_6] = 3 + 4 + 5 = 12, \\
[2 \cdot 1^2, E_8] &= [1^2, D_5] + [2 \cdot 1, E_6] + [2 \cdot 1^2, E_7] = 6 + 10 + 12 = 28, \\
[2 \cdot 1^3, E_8] &= [1^3, D_5] + [2 \cdot 1^2, E_6] + [2 \cdot 1^3, E_7] = 2 + 5 + 0 = 7, \\
[2^2, E_7] &= [2, A_4] + [2^2, E_6] = 3 + 1 = 4, \\
[2^2, E_8] &= [2, D_5] + [2^2, E_7] = 4 + 4 = 8, \\
[2^2 \cdot 1, E_8] &= [2 \cdot 1, D_5] + [2^2, E_6] + [2^2 \cdot 1, E_7] = 4 + 1 + 4 = 9, \\
[2^2 \cdot 1^2, E_8] &= [2 \cdot 1^2, D_5] + [2^2 \cdot 1, E_6] + [2^2 \cdot 1, E_7] = 1 + 1 + 0 = 2, \\
[3 \cdot 1, E_7] &= [1, A_2 + A_1] + [3, D_5] + [3 \cdot 1, E_6] = 3 + 4 + 4 = 11, \\
[3 \cdot 1, E_8] &= [1, A_4] + [3, E_6] + [3 \cdot 1, E_7] = 4 + 5 + 11 = 20, \\
[3 \cdot 1^2, E_8] &= [1^2, A_4] + [3 \cdot 1, E_6] + [3 \cdot 1^2, E_7] = 3 + 4 + 3 = 10, \\
[3 \cdot 2, E_8] &= [2, A_4] + [3, D_5] + [3 \cdot 2, E_7] = 3 + 4 + 3 = 10, \\
[3 \cdot 2 \cdot 1, E_8] &= [2 \cdot 1, A_4] + [3 \cdot 1, D_5] + [3 \cdot 2, E_6] + [3 \cdot 2 \cdot 1, E_7] \\
&= 2 + 1 + 0 + 1 = 4, \\
[3^2, E_8] &= [3, A_4] + [3^2, E_7] = 2 + 0 = 2, \\
[4 \cdot 1, E_7] &= [1, A_1] + [4, D_5] + [4 \cdot 1, E_6] = 1 + 2 + 2 = 5, \\
[4 \cdot 1, E_8] &= [1, A_2 + A_1] + [4, E_6] + [4 \cdot 1, E_7] = 3 + 4 + 5 = 12, \\
[4 \cdot 2, E_8] &= [2, A_2 + A_1] + [4, D_5] + [4 \cdot 2, E_7] = 1 + 2 + 1 = 4.
\end{aligned}$$

8. SOME REMARKS

8.1. Some results from the tables. By our classification we have the following.

Remark 8.1. Let Ξ be a subsystem of an irreducible root system Σ .

i) Let σ be an outer automorphism of Σ . Then $\sigma(\Xi) \underset{\Sigma}{\simeq} \Xi$ if (Σ, Ξ) does not satisfy the following condition.

$$(8.1) \quad \Sigma \simeq D_n \text{ with an even } n, \Xi \underset{\Sigma}{\simeq} \sum_j m_j A_j \text{ and } \sum_j (j+1)m_j = n.$$

ii) Suppose Ξ is irreducible. Then $\Xi^\perp \cap \Sigma$ is also irreducible if (Σ, Ξ) is not isomorphic to any one in the following list:

Σ	Ξ	Ξ^\perp	Σ	Ξ	Ξ^\perp
$B_n (n>3)$	A_1	$B_{n-2} + A_1$ or B_{n-1}	$C_n (n>3)$	A_1	$C_{n-2} + A_1$ or C_{n-1}
$D_n (n>4)$	A_1	$D_{n-2} + A_1$			
D_5	A_3	$2A_1$ or \emptyset	D_6	A_3	A_3 or $2A_1$
$D_n (n>7)$	A_{n-3}	$2A_1$	$D_n (n>6)$	D_{n-2}	$2A_1$

Remark 8.2 (orthogonal systems). A subsystem Ξ of Σ which is isomorphic to mA_1 with a certain positive integer m is called an *orthogonal system* of Σ . An orthogonal system is called *maximal* (resp. *strongly orthogonal*) if $\Xi^\perp = \emptyset$ (resp. S -closed).

Suppose Σ is irreducible. Let $\Xi = \langle \alpha_1, \dots, \alpha_m \rangle$ and $\Xi' = \langle \alpha'_1, \dots, \alpha'_m \rangle$ be orthogonal systems of Σ with rank m .

i) The rank of a maximal orthogonal system is given in Corollary 3.6 i) when $\Sigma = \Sigma^L$. If $\Sigma \neq \Sigma^L$, the rank equals $\text{rank } \Sigma$.

ii) If one of the following conditions is satisfied, then $\Xi \underset{\Sigma}{\sim} \Xi'$.

(8.2) Ξ and Ξ' are strongly orthogonal maximal systems,

(8.3) Σ is of type A_n, E_6, E_7 or E_8 and (Σ, Ξ) is not isomorphic to $(E_7, 3A_1), (E_7, 4A_1)$ or $(E_8, 4A_1)$.

iii) Let ι be a bijective map of Ξ to Ξ' with $(\iota(\alpha_j)|\iota(\alpha_j)) = (\alpha_j|\alpha_j)$ for $j = 1, \dots, m$. Suppose $m \geq 2$. Then there exists $w \in W_\Sigma$ with $\iota = w|_\Xi$ if one of the following conditions is satisfied.

(8.4) Σ is of type A_n, B_2, E_6, F_4 or G_2 .

(8.5) Σ is of type E_7 with $m \leq 2$.

(8.6) Σ is of type E_8 with $m \leq 3$.

See §8.2.2 and §8.2.3 for more details.

Remark 8.3 (fundamental subsystem). For a subsystem Ξ of an irreducible root system Σ and a subset $\Theta \subset \Psi$

$$(8.7) \quad \langle \Theta \rangle \simeq \Xi \text{ and } \langle \Theta \rangle \cap \Sigma^L \simeq \Xi \cap \Sigma^L \Rightarrow \langle \Theta \rangle \underset{\Sigma}{\simeq} \Xi$$

if (Σ, Ξ) is not isomorphic to any one of the following list.

(8.8) Σ is of type $B_n (n \geq 2), C_n (n \geq 3)$ or $D_n (n \geq 4)$
and Ξ has an A_3 component or more than one A_1 components.

(8.9) $(E_7, 4A_1), (E_7, A_3 + 2A_1), (E_7, A_5 + A_1),$
 $(E_8, 4A_1), (E_8, A_3 + 2A_1), (E_8, 2A_3), (E_8, A_5 + A_1), (E_8, A_7).$

(8.10) $(E_7, 3A_1), (E_7, A_5), (E_7, A_3 + A_1).$

If (Σ, Ξ) is isomorphic to one of the pairs in (8.10) and Ξ is a fundamental subsystem, then (8.7) is valid.

If (Σ, Ξ) is isomorphic to one of the pairs in (8.10), there exist $\Theta_1, \Theta_2 \subset \Psi$ such that $\Xi \simeq \langle \Theta_1 \rangle \simeq \langle \Theta_2 \rangle$, $\langle \Theta_1 \rangle \not\underset{\Sigma}{\simeq} \langle \Theta_2 \rangle$ and $\Xi \underset{\Sigma}{\simeq} \langle \Theta_1 \rangle$ or $\langle \Theta_2 \rangle$.

8.2. Further study of the action of the Weyl group. As for Q4 in §1, that is, “Is $\text{Out}(\Xi)$ realized by W_Σ ?” can be answered from the table in §10 by the condition $\# = \#\Xi$ and the answer is “yes” in most cases in the table. We will consider the

cases when the answer is “no”, namely, we will study the group $\text{Out}_\Sigma(\Xi)$ in $\text{Out}(\Xi)$ (cf. Definition 6.1). Under the notation in §10 we have

$$(8.11) \quad \#(\text{Out}(\Xi)/\text{Out}_\Sigma(\Xi)) = \#/\#\Xi.$$

If Σ is of the classical type, it is easy to analyze $\text{Out}_\Sigma(\Xi)$ because the action of W_Σ is easy. If Ξ is irreducible, $W_\Sigma(\Xi)$ is understood well by Theorem 3.3 using Dynkin diagrams. Moreover since $N_{W_\Sigma}(\Xi) \subset N_{W_\Sigma}(\Xi + \Xi^\perp)$, we have

$$(8.12) \quad \text{Out}_\Sigma(\Xi) \simeq \{g \in \text{Out}_\Sigma(\Xi + \Xi^\perp); g(\Xi) = \Xi\}$$

by (6.3) and therefore the group $\text{Out}_\Sigma(\Xi)$ is described by $\text{Out}_\Sigma(\Xi + \Xi^\perp)$. Hence we may assume Ξ is \perp -dense.

8.2.1. *Dual pairs.* If Ξ is not irreducible, $\text{Out}_\Sigma(\Xi)$ may be understood as a dual pair. For example the dual pair $(D_6, 2A_1)$ in E_8 is special and the imbedding $D_6 + 2A_1 \subset E_8$ is unique up to the transformations by W_{E_8} . Hence there exists $w \in N_{W_{E_8}}(D_6 + 2A_1)$ which swaps two A_1 's. Then w always defines a non-trivial element of $\text{Out}(D_6)$. Namely $\text{Out}_\Sigma(\Xi)$ is the diagonal subgroup of $\text{Out}(D_6 + 2A_1)$ through the isomorphism $\text{Out}(D_6) \simeq \text{Out}(2A_1)$. The following cases are understood in this way.

$$\begin{aligned} D_m + D_n &\subset D_{m+n} \quad (m \geq 2, n \geq 2, m \neq 4, n \neq 4), \\ A_3 + 2A_1 &\subset E_6, \\ 2A_3 + A_1 &\subset E_7, \quad A_5 + A_2 \subset E_7, \quad D_4 + 3A_1 \subset E_7, \\ E_6 + A_2 &\subset E_8, \quad A_5 + A_2 + A_1 \subset E_8, \quad A_4 + A_4 \subset E_8, \quad D_6 + 2A_1 \subset E_8, \\ D_5 + A_3 &\subset E_8, \quad D_4 + D_4 \subset E_8, \quad A_2 + A_2 \subset F_4 \end{aligned}$$

For the imbedding $\Xi \subset \Sigma$ in this list, a still more concrete description of $\text{Out}_\Sigma(\Xi)$ is desirable if $\text{Out}(\Xi) \not\cong \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$.

For the imbedding $D_m + D_m \simeq D_m^0 + D_m^m \subset D_{2m}$ under the notation in §10, the swapping of two D_m 's under the generators given there is in $\text{Out}_{D_{2m}}(D_m^0 + D_m^m)$ and therefore $\text{Out}_{D_{2m}}(D_m + D_m)$ is clear. Similarly for $2A_4 \subset E_8$, if we fix $A_3 + A_4 \subset A_4 + A_4 \subset E_8$ and $A_3 + A_4 \subset A_8 \subset E_8$, we can also specify the swapping of two A_4 's in $\text{Out}_{E_8}(2A_4)$. Other cases in the list are described by the study of the imbedding of $7A_1 \subset E_7$ and $8A_1 \subset E_8$ through $4A_1 \subset D_4$ as is shown later.

8.2.2. *Strongly orthogonal systems of the maximal rank.* Suppose Σ is of type $A_n, B_n, C_n, D_n, E_6, F_4$ or G_2 and put $m = 2\lfloor \frac{n}{2} \rfloor$. Then under the notation in §9 the strongly orthogonal system Θ_Σ of Σ with the maximal rank is weakly equivalent to

$$(8.13) \quad \Theta_{A_n} := \{\epsilon_1 - \epsilon_2, \epsilon_3 - \epsilon_4, \dots, \epsilon_{2m-1} - \epsilon_{2m}\},$$

$$(8.14) \quad \Theta_{D_n} := \{\epsilon_1 - \epsilon_2, \epsilon_1 + \epsilon_2, \epsilon_3 - \epsilon_4, \epsilon_3 + \epsilon_4, \dots, \epsilon_{2m-1} + \epsilon_{2m}\},$$

$$(8.15) \quad \Theta_{B_n} := \begin{cases} \Theta_{D_n} & (n = 2m), \\ \Theta_{D_n} \cup \{\epsilon_n\} & (n = 2m + 1), \end{cases}$$

$$(8.16) \quad \Theta_{C_n} := \{2\epsilon_1, \dots, 2\epsilon_n\},$$

$$(8.17) \quad \Theta_{E_6} := \{\epsilon_1 - \epsilon_2, \epsilon_1 + \epsilon_2, \epsilon_3 - \epsilon_4, \epsilon_3 + \epsilon_4\},$$

$$(8.18) \quad \Theta_{G_2} := \{\epsilon_1 - \epsilon_2, \epsilon_1 + \epsilon_2 - 2\epsilon_3\}.$$

Then $\text{Out}_\Sigma(\Theta_\Sigma)$ is identified with the subgroup of the permutation group of Θ_Σ , which is also identified with the permutation group $\mathfrak{S}_{\#\Theta_\Sigma}$ of $\{1, \dots, \#\Theta_\Sigma\}$ according to the expression of Θ_Σ by the above ordered set. Then

$$\begin{aligned} \text{Out}_\Sigma(\Theta_\Sigma) &\simeq \mathfrak{S}_{\#\Theta_\Sigma} \quad (\Sigma \text{ is of type } A_n, C_n, E_6, F_4), \\ \text{Out}_{G_2}(\Theta_{G_2}) &= \{1\}, \\ \text{Out}_{D_n}(\Theta_{D_n}) &= \begin{cases} \langle (1\ 2)(3\ 4), (1\ 3)(2\ 4), \\ (1\ 3 \cdots 2m-1)(2\ 4 \cdots 2m) \rangle \simeq W_{D_m} & (n = 2m), \\ \langle (1\ 2), (1\ 3)(2\ 4), \\ (1\ 3 \cdots 2m-1)(2\ 4 \cdots 2m) \rangle \simeq W_{B_m} & (n = 2m+1). \end{cases} \end{aligned}$$

Here the generators of $\text{Out}_{D_n}(\Theta_{D_n})$ are expressed by products of circular permutations. Note that the group $\text{Out}_{D_n}(\Theta_{D_n})$ is isomorphic to W_{D_m} or W_{B_m} if $n = 2m$ or $2m+1$, respectively.

8.2.3. $8A_1 \subset E_8$ and $7A_1 \subset E_7$. Since $\text{Out}(8A_1)$ is isomorphic to the symmetric group \mathfrak{S}_8 , $\text{Out}_{E_8}(8A_1)$ is identified with a subgroup of \mathfrak{S}_8 . Since $\#/\#\Xi = 30$, $\#\text{Out}_{E_8}(8A_1) = 8!/30 = 1344 = 2^6 \cdot 3 \cdot 7$. To be more precise, we fix $8A_1 \subset E_8$:

$$(8.19) \quad \begin{aligned} (8A_1)_o &:= \{\pm\alpha_2, \pm\alpha_3, \pm\alpha_5, \pm\alpha_q \pm \alpha_7, \pm\alpha_p, \pm\alpha_0^7, \pm\alpha_0^8\} \subset E_8, \\ \alpha_2 &= \epsilon_1 + \epsilon_2, \quad \alpha_3 = \epsilon_2 - \epsilon_1, \quad \alpha_5 = \epsilon_4 - \epsilon_3, \quad \alpha_7 = \epsilon_6 - \epsilon_5, \\ \alpha_p &= -\epsilon_5 - \epsilon_6, \quad \alpha_q = -\epsilon_3 - \epsilon_4, \quad \alpha_0^8 = -\epsilon_7 - \epsilon_8, \quad \alpha_0^7 = \epsilon_7 - \epsilon_8. \end{aligned}$$

$$(8.20) \quad \begin{array}{c} \alpha_0^7 \quad \alpha_1 \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \quad \alpha_7 \quad \alpha_8 \quad \alpha_0^8 \\ \bullet \cdots * \cdots \circ \cdots \circ \cdots \circ \cdots \circ \cdots * \cdots \bullet \quad \alpha_1 \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \quad \alpha_7 \quad \alpha_8 \quad \alpha_0^8 \\ \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \quad \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \cdots \circ \\ \circ \alpha_2 \quad \ominus \alpha_p \quad \circ \alpha_2 \quad \ominus \alpha_t \end{array}$$

Here we used the notation in §7.2 and §10. In particular $E_7 \subset E_8$. Note that α_0^8 and α_0^7 are negatives of maximal roots of E_8 and E_7 , respectively. We identify \mathfrak{S}_8 with the permutation group of the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ of numbers and this ordered set is also identified with the ordered set given as generators of $(8A_1)_o$ in (8.19).

Since $(\alpha_0^8)^\perp = E_7$, the left figure above corresponds to the first diagram in §7.2. Since $(D_8)_o := \langle \alpha_2, \alpha_3, \dots, \alpha_8, \alpha_0^8 \rangle$ is of type D_8 , its extended diagram is given in the right figure of (8.20) with the negative α_t of its maximal root. Here we note that $\alpha_0^7 < 0$ and $\alpha_t > 0$. Since $(D_6)_o^\perp \cap (\alpha_0^8)^\perp \simeq A_1$ by denoting $(D_6)_o := \langle \alpha_2, \dots, \alpha_7 \rangle$, we have $\alpha_t = -\alpha_0^7$. Then $\text{Out}_{(D_8)_o}((8A_1)_o)$ is generated by

$$(8.21) \quad g_1 = (1\ 3\ 5\ 7)(2\ 4\ 6\ 8),$$

$$(8.22) \quad g_2 = (1\ 3)(2\ 4),$$

$$(8.23) \quad g_3 = (1\ 2)(3\ 4).$$

Here the generators g_j are expressed by products of cyclic permutations in \mathfrak{S}_8 . Note that $\#\text{Out}_{(D_8)_o}((8A_1)_o) = 2^3 \cdot 4! = 2^6 \cdot 3$.

Now we will consider the other diagram in §7.2.

$$\begin{array}{c} \alpha_0^7 \quad \circ \alpha_s \\ \circ \quad \alpha_3 \quad \alpha_4 \quad \alpha_5 \quad \alpha_6 \quad \alpha_7 \quad \alpha_8 \quad \alpha_0^8 \\ \circ \quad \circ \quad * \quad \bullet \quad * \quad \bullet \quad * \quad \bullet \\ \circ \alpha_r \quad \ominus \alpha_2 \end{array} \quad \alpha_r = -\alpha_p, \quad \alpha_s = -\alpha_q$$

This shows that the element

$$(8.24) \quad g_4 = (2\ 4)(6\ 7)$$

which corresponds to an element of the $W_{\langle \alpha_0^7, \alpha_1, \alpha_3, \alpha_r \rangle} \simeq W_{D_4}$ is in $\text{Out}_{E_8}((8A_1)_o)$ and not in $\text{Out}_{(D_8)_o}((8A_1)_o)$. Then we can conclude that $\text{Out}_{E_8}((8A_1)_o)$ is generated by g_j ($j = 1, 2, 3, 4$), which is clear by considering the order of the groups.

Put $(7A_1)_o = (8A_1)_o \setminus \{\pm\alpha_0^8\}$. Since $E_7 = (\alpha_0^8)^\perp$, it is easy to see that $\text{Out}_{E_7}((7A_1)_o)$ is generated by g_2, g_3, g_4 and

$$(8.25) \quad g'_1 = (1 \ 3 \ 5)(2 \ 4 \ 6).$$

Here we naturally identify $\text{Out}(7A_1)$ with \mathfrak{S}_7 and we have

$$(8.26) \quad \text{Out}_{E_8}((8A_1)_o) = \langle g_1, g_2, g_3, g_4 \rangle, \quad \#\text{Out}_{E_8}((8A_1)_o) = 2^6 \cdot 3 \cdot 7 = 1344,$$

$$(8.27) \quad \text{Out}_{E_7}((7A_1)_o) = \langle g'_1, g_2, g_3, g_4 \rangle, \quad \#\text{Out}_{E_7}((7A_1)_o) = 2^3 \cdot 3 \cdot 7 = 168.$$

Put $(6A_1)_o = \{\pm\alpha_2, \pm\alpha_3, \pm\alpha_5, \pm\alpha_q, \pm\alpha_7, \pm\alpha_p\} \subset \{\alpha_0^7, \alpha_0^8\}^\perp \simeq D_6$ and $(5A_1)_o = \{\pm\alpha_2, \pm\alpha_3, \pm\alpha_5, \pm\alpha_q, \pm\alpha_7\} \subset \{\alpha_p, \alpha_0^7, \alpha_0^8\}^\perp \simeq D_4 + A_1$. Note that $(D_6, 2A_1)$ and $(D_4 + A_1, 3A_1)$ are special dual pairs in E_8 and therefore $\text{Out}_{E_8}(D_6) = \text{Out}(D_6)$ and $\text{Out}_{E_8}(D_4 + A_1) = \text{Out}(D_4 + A_1)$. Then we have easily

$$(8.28) \quad \text{Out}_{E_8}((7A_1)_o) \overset{\sim}{\leftarrow} \text{Out}_{E_7}((7A_1)_o),$$

$$(8.29) \quad \text{Out}_{E_8}((6A_1)_o) = \langle g'_1, g_2, (1 \ 2) \rangle \simeq W_{B_3}, \quad \#\text{Out}_{E_8}((6A_1)_o) = 48,$$

$$(8.30) \quad \text{Out}_{E_7}((6A_1)_o) = \langle g'_1, g_2, g_3 \rangle \simeq W_{D_3}, \quad \#\text{Out}_{E_8}((6A_1)_o) = 24,$$

$$(8.31) \quad \text{Out}_{E_8}((5A_1)_o) = \langle (1 \ 2), (2 \ 3), (3 \ 4) \rangle \simeq W_{A_3}, \quad \#\text{Out}_{E_8}((5A_1)_o) = 24,$$

$$(8.32) \quad \text{Out}_{E_7}((5A_1)_o) = \langle g_2, (1 \ 2) \rangle \simeq W_{B_2}, \quad \#\text{Out}_{E_8}((5A_1)_o) = 8.$$

Put $(4A_1)_o = \{\pm\alpha_2, \pm\alpha_3, \pm\alpha_5, \pm\alpha_q\}$ and $(4A_1)_1 = \{\pm\alpha_2, \pm\alpha_3, \pm\alpha_5, \pm\alpha_7\}$. Then $(4A_1)_o^\perp \cap E_8 \simeq D_4$, $(4A_1)_o^{\perp\perp} \simeq D_4$ and $(4A_1)_1^\perp \cap E_8 \simeq 4A_1$ and $(4A_1)_1^{\perp\perp} = (4A_1)_1$.

8.2.4. $2D_4 \subset E_8$, $D_4 + 4A_1 \subset E_8$ and $D_4 + 3A_1 \subset E_7$. Retain the notation in the previous section (cf. (8.20)) and put

$$(8.33) \quad (2D_4)_o = \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_q \rangle + \langle \alpha_7, \alpha_t, \alpha_8, \alpha_0^8, \alpha_p \rangle \subset E_8,$$

$$(8.34) \quad (D_4 + 4A_1)_o = \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_q \rangle + \langle \alpha_7, \alpha_t, \alpha_0^8, \alpha_p \rangle \subset E_8,$$

$$(8.35) \quad (D_4 + 3A_1)_o = \langle \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_q \rangle + \langle \alpha_7, \alpha_t, \alpha_p \rangle \subset E_7.$$

Then we have the natural identification

$$\begin{aligned} \text{Out}_{E_8}((2D_4)_o) &\supset \text{Out}_{E_7}((D_4 + 3A_1)_o) \\ &\simeq \{g \in \text{Out}_{E_8}((8A_1)_o); g(\alpha_q) = \alpha_q \text{ and } g(\alpha_0^8) = \alpha_0^8\} \end{aligned}$$

together with (2.19) and therefore $\text{Out}_{E_7}((D_4 + 3A_1)_o)$ is generated by

$$(1 \ 2)(5 \ 6) : \alpha_2 \leftrightarrow \alpha_3, \alpha_7 \leftrightarrow \alpha_0^7 \text{ and } (1 \ 3)(6 \ 7) : \alpha_2 \leftrightarrow \alpha_5, \alpha_7 \leftrightarrow \alpha_t.$$

Here the first element corresponds to an element in $W_{(D_8)_o}$ and the second element equals g_2g_4 . Moreover $\text{Out}_{E_8}((2D_4)_o)$ contains $(1 \ 5)(2 \ 6)(3 \ 7)(4 \ 8)$ and $\text{Out}_{E_8}((D_4 + 4A_1)_o)$ contains $\text{Out}_{(2D_4)_o}((D_4 + 4A_1)_o)$. Hence

$$\begin{aligned} \text{Out}_{E_7}((D_4 + 3A_1)_o) &= \langle (1 \ 2)(5 \ 6), (1 \ 3)(6 \ 7) \rangle, \\ \#\text{Out}_{E_7}((D_4 + 3A_1)_o) &= 6, \\ \text{Out}_{E_8}((2D_4)_o) &= \langle (1 \ 2)(5 \ 6), (1 \ 3)(6 \ 7), (1 \ 5)(2 \ 6)(3 \ 7)(4 \ 8) \rangle, \\ \#\text{Out}_{E_8}((2D_4)_o) &= 12, \\ \text{Out}_{E_8}((D_4 + 4A_1)_o) &= \langle (5 \ 6)(7 \ 8), (5 \ 8)(6 \ 7), \text{Out}_{E_8}((2D_4)_o) \rangle, \\ \#\text{Out}_{E_8}((D_4 + 4A_1)_o) &= 48. \end{aligned}$$

8.2.5. $4A_2 \subset E_8$, $3A_2 \subset E_7$ and $3A_2 \subset E_6$. First note that as groups, $\text{Out}(4A_2)$ and $\text{Out}(3A_1)$ are isomorphic to W_{B_4} and W_{B_3} and their orders of the groups are $2^4 \cdot 4!$ and $2^3 \cdot 3!$, respectively. Fix a representative $4A_2 \subset E_8$:

$$\begin{aligned} \alpha_2 &= \epsilon_1 + \epsilon_2, & \alpha_0^6 &= -\frac{1}{2}(\epsilon_1 + \epsilon_2 + \epsilon_3 + \epsilon_4 + \epsilon_5 - \epsilon_6 - \epsilon_8 + \epsilon_8), \\ \alpha_3 &= \epsilon_2 - \epsilon_1, & \alpha_1 &= \frac{1}{2}(\epsilon_1 + \epsilon_8) - \frac{1}{2}(\epsilon_2 + \epsilon_3 + \epsilon_4 + \epsilon_5 + \epsilon_6 + \epsilon_7), \\ \alpha_5 &= \epsilon_4 - \epsilon_3, & \alpha_6 &= \epsilon_5 - \epsilon_4, \\ \alpha_8 &= \epsilon_7 - \epsilon_6, & \alpha_0^8 &= -\epsilon_7 - \epsilon_8, \end{aligned}$$
$$\begin{aligned} (4A_2)_0 &= \langle \{\alpha_2, \alpha_0^6, \alpha_3, \alpha_1, \alpha_5, \alpha_6, \alpha_8, \alpha_0^8\} \rangle, \\ (3A_2)_0 &= \langle \{\alpha_2, \alpha_0^6, \alpha_3, \alpha_1, \alpha_5, \alpha_6\} \rangle. \end{aligned}$$

Then the permutation group of the 8 generators of $(4A_2)_o$ is identified with \mathfrak{S}_8 as in the case of $(8A_1)_o \subset E_8$. Then $\text{Out}((4A_2)_o) = \langle g_1, g_2, g_3 \rangle$ and $\text{Out}(3A_2)_o = \langle g'_1, g_2, g_3 \rangle$ (cf. (8.21)–(8.25)). Note that

$$\begin{aligned} \# \text{Out}_{E_6}((3A_2)_o) &= \# \text{Out}((3A_2)_o)/8 = 6, \\ \# \text{Out}_{E_7}((3A_2)_o) &= \# \text{Out}((3A_2)_o)/4 = 12, \\ \# \text{Out}_{E_8}((4A_2)_o) &= \# \text{Out}((4A_2)_o)/8 = 48, \\ \text{Out}_{E_6}((3A_2)_o) &\subset \text{Out}_{E_8}((4A_2)_o). \end{aligned}$$

Since $(2A_2, 2A_2)$ is a special dual pair in E_8 , we have

$$(8.36) \quad (\exists 2A_2 \subset (4A_2)_o \text{ such that } w|_{2A_2} = id) \Rightarrow w = id$$

for $w \in \text{Out}_{E_8}((4A_2)_o)$. We will choose elements in $\text{Out}_{E_8}((2A_2)_o)$. The rotation of the extended Dynkin diagram of E_6 comes from W_{E_6} and therefore the element

$$(8.37) \quad h_1 = (1 \ 3 \ 5)(2 \ 4 \ 6)$$

is contained in $\text{Out}_{E_6}((3A_2)_o)$. The argument §7.1 shows that in view of the transformation of an element of $W_{(\alpha_0^8, \alpha_2, \alpha_4, \alpha_5, \alpha_6)}$, $(1 \ 6)(2 \ 5)$ or $(1 \ 6)(2 \ 5)(3 \ 4)$ should be in $W_{E_6}((3A_2)_o)$. Owing to (8.36), we can conclude that

$$(8.38) \quad h_2 = (1 \ 6)(2 \ 5)(3 \ 4)$$

is contained in the group and $\text{Out}_{E_6}((3A_2)_o) = \langle h_1, h_2 \rangle$.

Since $\overline{\text{Hom}}(E_6, E_7) = 1$, $\text{Out}_{E_7}((3A_2)_o)$ contains

$$(8.39) \quad h_3 = (3 \ 5)(4 \ 6).$$

Considering in $(A_8)_o = \langle \alpha_1, \alpha_3, \alpha_4, \alpha_5, \alpha_6, \alpha_7, \alpha_8, \alpha_0^8 \rangle \simeq A_8$, there is an element $w \in W_{(A_8)_o}$ such that

$$w(\alpha_1) = \alpha_1, \quad w(\alpha_3) = \alpha_3, \quad w(\alpha_4) = \alpha_6, \quad w(\alpha_5) = \alpha_7, \quad w(\alpha_6) = \alpha_4, \quad w(\alpha_7) = \alpha_5.$$

Then it also follows from (8.36) that

$$(8.40) \quad h_4 = (1 \ 2)(5 \ 7)(6 \ 8)$$

is in $\text{Out}_{E_8}((4A_2)_o)$. Calculating the order of the group, we have

$$(8.41) \quad \text{Out}_{E_6}((3A_2)_o) = \langle h_1, h_2 \rangle, \quad \# \text{Out}_{E_6}((3A_2)_o) = 6,$$

$$(8.42) \quad \text{Out}_{E_7}((3A_2)_o) = \langle h_1, h_2, h_3 \rangle, \quad \# \text{Out}_{E_7}((3A_2)_o) = 12,$$

$$(8.43) \quad \text{Out}_{E_8}((4A_2)_o) = \langle h_1, h_2, h_4 \rangle, \quad \# \text{Out}_{E_8}((4A_2)_o) = 48.$$

9. LIST OF IRREDUCIBLE ROOT SYSTEMS

$$\Sigma = \{\pm(\epsilon_i - \epsilon_j); 1 \leq i < j \leq n+1\},$$

$$\alpha_j = \epsilon_j - \epsilon_{j+1} \quad (j = 1, \dots, n), \quad \alpha_0 = \epsilon_{n+1} - \epsilon_1 \quad (n > 1), \quad \#W = (n+1)!.$$

$$\begin{aligned} \Sigma &= \{ \pm(\epsilon_i - \epsilon_j), \mp(2\epsilon_1 - \epsilon_2 - \epsilon_3), \mp(2\epsilon_2 - \epsilon_1 - \epsilon_3), \pm(2\epsilon_3 - \epsilon_1 - \epsilon_2); \\ &\quad 1 \leq i < j \leq 3 \}, \\ \alpha_1 &= -2\epsilon_1 + \epsilon_2 + \epsilon_3, \quad \alpha_2 = \epsilon_1 - \epsilon_2, \quad \alpha_0 = \epsilon_1 + \epsilon_2 - 2\epsilon_3, \quad \#W = 12. \end{aligned}$$

10. TABLES

In this section we assume that Σ is an irreducible and reduced root system and we will classify $\text{Hom}(\Xi, \Sigma)$ under a suitable isomorphisms for every root system Ξ .

Definition 10.1. For $\iota, \iota' \in \text{Hom}(\Xi, \Sigma)$ we define that ι is *weakly equivalent* to ι' if and only if there exists $g \in \text{Aut}(\Sigma) = \text{Hom}(\Sigma, \Sigma)$ with $\iota'(\Xi) = g \circ \iota(\Xi)$, that is, $\iota'(\Xi) \stackrel{w}{\sim}_{\Sigma} \iota(\Xi)$. Then $\text{Hom}(\Xi, \Sigma)$ is decomposed into the equivalence classes.

In many cases $\text{Hom}(\Xi, \Sigma)$ itself is the equivalence class but if it is not so, we will identify every equivalence class $\text{Hom}(\Xi, \Sigma)_o$ contained in $\text{Hom}(\Xi, \Sigma)$ by a suitable geometric condition.

In the tables in this section we will list up all Ξ with $\text{Hom}(\Xi, \Sigma) \neq \emptyset$ and classify them with some data with the following notation.

$$\begin{aligned} \text{Aut}(\Xi) &:= \text{Hom}(\Xi, \Xi), & \text{Aut}(\Sigma) &:= \text{Hom}(\Sigma, \Sigma) \\ \text{Aut}'(\Xi) &:= \prod_{j=1}^m \text{Aut}(\Xi_j) \subset \text{Aut}(\Xi) \text{ for the irreducible decomposition} \\ & \Xi = \Xi_1 + \cdots + \Xi_m \\ \# &: \#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)_o) \\ \#_\Xi &: \#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)_o / \text{Aut}(\Xi)) \\ \#_{\Xi'} &: \#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)_o / \text{Aut}'(\Xi)) \\ \#_\Sigma &: \#(\text{Aut}(\Sigma) \backslash \text{Hom}(\Xi, \Sigma)_o) \\ \Xi^{\perp\perp} &: \begin{cases} \circ & (\bar{\Xi} = \Xi \text{ and (6.9) is valid}) \\ \times & (\bar{\Xi} = \Xi \text{ but (6.9) is not valid}) \\ (\Xi^\perp)^\perp & (\bar{\Xi} \neq \Xi) \end{cases} \\ P &: \#\{\Theta \subset \Psi; \langle \Theta \rangle \stackrel{w}{\sim} \Xi\} \quad (\text{if } \Xi \text{ is fundamental}) \\ S &: S\text{-closure} \quad (\text{if } \Xi \text{ is not } S\text{-closed (cf. Definition 6.6)}) \\ \langle j_1, \dots, j_m \rangle &: \langle \alpha_{j_1}, \dots, \alpha_{j_m} \rangle \quad (\text{under the notation in } \S 9) \\ \langle \setminus j \rangle &: \langle \Psi \setminus \{\alpha_j\} \rangle \end{aligned}$$

For subsystem $\Xi \subset \Sigma$ and a subgroup G of $\text{Aut}(\Sigma)$ we put

$$\begin{aligned} \text{Hom}(\Xi, \Sigma)_o &:= \{\iota \in \text{Hom}(\Xi, \Sigma); \iota(\Xi) \stackrel{w}{\sim} \Xi\}, \\ O_\Xi^w &:= \{\Theta \subset \Sigma; W_\Theta \Theta = \Theta \text{ and } \Theta \stackrel{w}{\sim} \Xi\} \quad (\text{cf. Definition 2.8}), \\ O_\Xi &:= \{\Theta \subset \Sigma; W_\Theta \Theta = \Theta \text{ and } \Theta \sim \Xi\}, \\ N_G(\Xi) &:= \{g \in G; g(\Xi) = \Xi\}. \end{aligned}$$

Then

$$\begin{aligned} O_\Xi^w &\simeq \text{Hom}(\Xi, \Sigma)_o / \text{Aut}(\Xi) \simeq \text{Aut}(\Sigma) / N_{\text{Aut}(\Sigma)}(\Xi), \\ O_\Xi &\simeq W_\Sigma / N_{W_\Sigma}(\Xi), \\ (10.1) \quad \#O_\Xi^w / \#O_\Xi &= \#(W_\Xi \backslash \text{Hom}(\Xi, \Sigma)_o / \text{Aut}(\Xi)) = (\#_\Xi), \\ (10.2) \quad (\#) / (\#_\Xi) &= \#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)_o) / \#(W_\Sigma \backslash \text{Hom}(\Xi, \Sigma)_o / \text{Aut}(\Xi)) \\ &= \#(\text{Out}(\Xi) / \text{Out}_\Sigma(\Xi)) \\ &= \# \left(\text{Out}(\Xi) / (N_{W_\Sigma}(\Xi) / (W_\Xi \times W_{\Xi^\perp})) \right), \\ (10.3) \quad \#O_\Xi &= (\#) \cdot \#W_\Xi / ((\#_\Sigma) \cdot \#\text{Out}(\Xi) \cdot \#W_\Xi \cdot \#W_{\Xi^\perp}). \end{aligned}$$

Here $(\#)$, $(\#_\Xi)$, $(\#_{\Xi'})$ and $(\#_\Sigma)$ are numbers given in the columns indicated by $\#$, $\#_\Xi$, $\#_{\Xi'}$ and $\#_\Sigma$ in the table below, respectively. Since $1 \leq (\#_\Xi) \leq (\#_{\Xi'})$, $(\#_\Xi)$ may not be written if $(\#_{\Xi'}) = 1$. If $\text{Out}(\Sigma)$ is trivial, $(\#_\Sigma) = (\#)$ and therefore $(\#_\Sigma)$ may not be written.

Remark 10.2. The answers to the questions in the introduction are given by the table in this section as follows.

Answers to Q1 and Q2 are given in the table.

The number in Q3 is obtained by (10.3) with the table.

The answer to Q4 is yes if and only if $(\#\Xi) = (\#)$ (cf. Remark 10.7 iii)).

The answer to Q5 is yes if and only if $(\#\Xi') = (\#)$.

The answer to Q6 is yes if and only if $(\#\Xi) = 1$ (cf. Remark 8.1 i)).

The number in Q7 is obtained by the column P in the table (cf. Remark 8.3).

10.1. **Classical type.** $(\Sigma : A_n, B_n, C_n, D_n)$

Ξ : Irreducible

C_n ($2 < m < n$)	C_m	1	1	1	C_{n-m}	\circ	1

Suppose $n > 4$. Then $\#\overline{\text{Hom}}(A_{n-1}, D_n) = 2$ and the non-trivial element $g \in \text{Out}(D_n)$ maps its element to the other. Let $A_{n-1} \subset D_n$ by the notation in §10. Then $h \in \text{Aut}(D_n)$ defined by $h(\epsilon_j) = -\epsilon_j$ ($j = 1, \dots, n$) induces the non-trivial element of $\text{Out}(A_{n-1})$. Here h is not an element of W_{D_n} if and only if n is odd. Hence $\#(\overline{\text{Hom}}(A_{n-1}, D_n)/\text{Out}(A_{n-1})) = 1$ if and only if n is odd.

$$\Sigma = D_4$$

Σ	Ξ	$\#$	$\#\Xi$	$\#\Xi'$	$\#\Sigma$	Ξ^\perp	$\Xi^{\perp\perp}$	P
D_4	A_1	1	1	1	1	$3A_1$	\times	4
D_4	A_2	1	1	1	1	\emptyset	Σ	3
D_4	A_3	3	3	3	1	\emptyset	Σ	3
D_4	D_4	6	1	1	1	\emptyset	Σ	1
D_4	$2A_1$	3	3	3	1	$2A_1$	\circ	3
D_4	$3A_1$	6	1	6	1	A_1	\times	1
D_4	$4A_1$	6	1	6	1	\emptyset	Σ	

Σ : not of type D_4

We still assume that Σ is irreducible and of classical type. We will examine $\text{Hom}(\Xi, \Sigma)$ when Ξ may not be irreducible. It is not difficult because the root system and its Weyl group are easy to describe. The subsystems of Σ can be imbedded in the root space B_N with a sufficiently large N . We should distinguish two subsystems which are isomorphic as root systems but they are not equivalent by B_N .

Under the notation in §9 they are the followings:

$$\begin{aligned} A_1 &= \{\pm(\epsilon_1 - \epsilon_2)\}, \\ B_1 &= \{\pm\epsilon_1\} \simeq A_1, \\ D_2 &= \langle \epsilon_1 - \epsilon_2, \epsilon_1 + \epsilon_2 \rangle \simeq 2A_1, \\ A_3 &= \langle \epsilon_1 - \epsilon_2, \epsilon_2 - \epsilon_3, \epsilon_3 - \epsilon_4 \rangle, \\ D_3 &= \langle \epsilon_1 - \epsilon_2, \epsilon_2 - \epsilon_3, \epsilon_2 + \epsilon_3 \rangle \simeq A_3. \end{aligned}$$

Let $\{\epsilon_1, \dots, \epsilon_N\}$ be an orthonormal basis of \mathbb{R}^N with a sufficiently large positive integer N . Let σ be an element of $O(N)$ defined by $\sigma(\epsilon_j) = \epsilon_{j+1}$ for $1 \leq j < N$ and $\sigma(\epsilon_N) = \epsilon_1$. Let A_n, B_n, C_n and D_n denote the corresponding root spaces given in §9 and we identify them with finite subsets of \mathbb{R}^N and put $Q_n^i := \sigma^i(Q_n)$ for $Q = A, B, C$ and D . For example

$$A_4^3 = \langle \epsilon_4 - \epsilon_5, \epsilon_5 - \epsilon_6, \epsilon_7 - \epsilon_8, \epsilon_8 - \epsilon_9 \rangle \subset \mathbb{R}^N$$

For $\mathbf{m} = (m_1, m_2, \dots)$, $\mathbf{k} = (k_1, k_2, \dots)$, $\mathbf{n} = (n_1, n_2, \dots) \in \mathbb{N}^{\mathbb{N}}$ with

$$(10.4) \quad k_1 = 0 \text{ and } \sum_{j=1}^{\infty} |m_j + k_j + n_j| < \infty$$

define

$$\begin{aligned} \Xi_{\mathbf{m}} &:= \bigcup_{j \geq 1} \bigcup_{\nu=0}^{k_j-1} A_j^{(j+1)\nu + \sum_{i=1}^{j-1} (i+1)m_i} \simeq \sum_{j \geq 1} m_j A_j, \\ M(\mathbf{m}) &:= \sum_{j \geq 1} (j+1)m_j, \\ \Xi_{\mathbf{m}, \mathbf{k}} &= \Xi_{\mathbf{m}} \cup \bigcup_{j \geq 2} \bigcup_{\nu=0}^{k_i-1} D_j^{M(\mathbf{m}) + j\nu + \sum_{i=1}^{j-1} ik_i} \text{ with } D_2 = \langle \epsilon_1 - \epsilon_2, \epsilon_1 + \epsilon_2 \rangle \end{aligned}$$

$$\begin{aligned}
M(\mathbf{m}, \mathbf{k}) &:= M(\mathbf{m}) + \sum_{j \geq 2} j k_j, \\
p_D(\mathbf{m}, \mathbf{k}) &:= ((m_1 + 2k_2, m_2, m_3 + k_3, m_4, \dots), (0, 0, 0, k_4, k_5, \dots)), \\
\Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}} &:= \Xi_{\mathbf{m}, \mathbf{k}} \cup \bigcup_{j \geq 1} \bigcup_{\nu=0}^{k_j-1} B_j^{M(\mathbf{m}, \mathbf{k}) + j\nu + \sum_{i=1}^{j-1} i k_i} \text{ with } B_1 = \langle \epsilon_1 \rangle \\
&\sim_{B_N} \sum_{j \geq 1} m_j A_1 + \sum_{j \geq 2} k_j D_j + \sum_{j \geq 1} n_j B_j, \\
M(\mathbf{m}, \mathbf{k}, \mathbf{n}) &:= M(\mathbf{m}, \mathbf{k}) + \sum_{j \geq 1} j n_j = \sum_{j \geq 1} (j+1) m_j + \sum_{j \geq 1} j(k_j + n_j), \\
p_B(\mathbf{m}, \mathbf{k}, \mathbf{n}) &:= ((m_1 + n_1 + 2k_2, m_2, m_3 + k_3, m_4, \dots), (0, 0, 0, k_4, k_5, \dots), \\
&\quad (0, n_2, n_3, \dots)).
\end{aligned}$$

Suppose $n \geq M(\mathbf{m}, \mathbf{k}, \mathbf{n})$. Then $\Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}}$ is naturally a subsystem of B_n and

$$(10.5) \quad \Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}}^\perp \cap B_n \simeq k_1 A_1 + B_{n-M(\mathbf{m}, \mathbf{k}, \mathbf{n})}$$

and if there exists $w \in \text{Aut}(B_n) = W_{B_n}$ such that

$$\Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}} = w(\Xi_{\mathbf{m}', \mathbf{k}', \mathbf{n}'}),$$

then $(\mathbf{m}, \mathbf{k}, \mathbf{n}) = (\mathbf{m}', \mathbf{k}', \mathbf{n}')$.

Fix elements $\bar{\mathbf{m}} = (\bar{m}_1, \bar{m}_2, \dots)$, $\bar{\mathbf{k}} = (\bar{k}_1, \bar{k}_2, \dots)$ and $\bar{\mathbf{n}} = (\bar{n}_1, \bar{n}_2, \dots)$ in $\mathbb{N}^{\mathbb{N}}$ satisfying

$$(10.6) \quad \bar{k}_1 = \bar{k}_2 = \bar{k}_3 = \bar{n}_1 = 0.$$

Proposition 10.3 (type B_n ($n \geq 2$)). *Let*

$$(10.7) \quad \Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}} = \sum_{j \geq 1} \bar{m}_j A_j + \sum_{j \geq 4} \bar{k}_j D_j + \sum_{j \geq 2} \bar{n}_j B_j.$$

Then

$$(10.8) \quad \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n) = \coprod_{\substack{p_B(\mathbf{m}, \mathbf{k}, \mathbf{n}) = (\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}) \\ M(\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}) \leq n}} \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n)_{(\mathbf{m}, \mathbf{k}, \mathbf{n})},$$

$$\text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n)_{(\mathbf{m}, \mathbf{k}, \mathbf{n})} := \{ \iota \in \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n); \text{ there exists } \\ w \in W_{B_n} \text{ such that } w(\Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}}) = \iota(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}) \}$$

and

$$(10.9) \quad \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n)_{(\mathbf{m}, \mathbf{k}, \mathbf{n})} \neq \emptyset \\ \Leftrightarrow p_B(\mathbf{m}, \mathbf{k}, \mathbf{n}) = (\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}) \text{ and } M(\mathbf{m}, \mathbf{k}, \mathbf{n}) \leq n.$$

Assume this condition. Then

$$(10.10) \quad \#(W_{B_n} \setminus \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n)_{(\mathbf{m}, \mathbf{k}, \mathbf{n})}) = \frac{3^{k_4} \cdot (m_1 + n_1 + 2k_2)! \cdot (m_3 + k_3)!}{2^{k_2} \cdot m_1! \cdot n_1! \cdot k_2! \cdot m_3! \cdot k_3!},$$

$$(10.11) \quad \#(W_{B_n} \setminus \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}, B_n)_{(\mathbf{m}, \mathbf{k}, \mathbf{n})} / \text{Aut}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}})) = 1,$$

$$(10.12) \quad \Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}^\perp \cap B_n \simeq m_1 A_1 + B_{n-M(\mathbf{m}, \mathbf{k}, \mathbf{n})},$$

$$(10.13) \quad \bar{\Xi}_{\mathbf{m}, \mathbf{k}, \mathbf{n}} = \Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}} \Leftrightarrow m_2 = m_3 = \dots = k_2 = k_3 = \dots = 0, \sum_{j \geq 1} n_j \leq 1,$$

$$(10.14) \quad \Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}} \text{ is fundamental} \Leftrightarrow k_2 = k_3 = \dots = 0 \text{ and } \sum_{j \geq 1} n_j \leq 1.$$

The S -closure of $\Xi_{\mathbf{m}, \mathbf{k}, \mathbf{n}}$ equals $\Xi_{\mathbf{m}, \mathbf{k}, (\delta_\nu, \sum_j j n_j)_\nu}$. Here $\sum n_j B_j$ changes into $B_{\sum_j j n_j}$.

By taking the dual root systems, we have

Proposition 10.4 (type C_n ($n \geq 3$)). *Let*

$$(10.15) \quad \Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}} = \sum_{j \geq 1} \bar{m}_j A_j + \sum_{j \geq 4} \bar{k}_j D_j + \sum_{j \geq 2} \bar{n}_j C_j.$$

Then the statements in Proposition 10.3 with replacing B_n and $B_{n-M(\mathbf{m}, \mathbf{k}, \mathbf{n})}$ by C_n and $C_{n-M(\mathbf{m}, \mathbf{k}, \mathbf{n})}$, respectively, are valid except for the last statement on S -closure.

The S -closure of this $\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}, \bar{\mathbf{n}}}$ is $\Xi_{\mathbf{m}, 0, (n_1, k_2+n_2, k_3+n_3, \dots)}$, which is obtained by replacing $\sum k_j D_j$ by $\sum k_j C_j$.

Proposition 10.5 (type D_n ($n \geq 5$)). *Let*

$$(10.16) \quad \Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}} = \sum_{j \geq 1} \bar{m}_j A_j + \sum_{j \geq 4} \bar{k}_j D_j.$$

Then

$$(10.17) \quad \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n) = \prod_{\substack{p_D(\mathbf{m}, \mathbf{k}) = (\bar{\mathbf{m}}, \bar{\mathbf{k}}) \\ M(\mathbf{m}, \mathbf{k}) \leq n}} \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})},$$

$$\text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})} := \{ \iota \in \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n); \text{ there exists } w \in W_{B_n} \\ \text{such that } w(\Xi_{\mathbf{m}, \mathbf{k}}) = \iota(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}) \},$$

$$(10.18) \quad \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})} \neq \emptyset \Leftrightarrow p_D(\mathbf{m}, \mathbf{k}) = (\bar{\mathbf{m}}, \bar{\mathbf{k}}) \text{ and } M(\mathbf{m}, \mathbf{k}) \leq n.$$

If (10.18) holds,

$$(10.19) \quad \#(W_{D_n} \setminus \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})}) = \varepsilon_1 \frac{3^{k_4} \cdot (m_1 + 2k_2)! \cdot (m_3 + k_3)!}{2^{k_2} \cdot m_1! \cdot k_2! \cdot m_3! \cdot k_3!},$$

$$(10.20) \quad \#(W_{D_n} \setminus \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})} / \text{Aut}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}})) = \varepsilon_2,$$

$$(10.21) \quad \#(\text{Aut}(D_n) \setminus \text{Hom}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}, D_n)_{(\mathbf{m}, \mathbf{k})} / \text{Aut}(\Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}})) = 1,$$

$$(10.22) \quad \Xi_{\bar{\mathbf{m}}, \bar{\mathbf{k}}}^\perp \simeq mA_1 + D_{n-M(\mathbf{m}, \mathbf{k})},$$

$$(10.23) \quad \bar{\Xi}_{\mathbf{m}, \mathbf{k}} = \Xi_{\mathbf{m}, \mathbf{k}} \Leftrightarrow k_2 = k_3 = \dots = 0 \text{ and } M(\mathbf{m}, \mathbf{k}) \neq n - 1,$$

$$(10.24) \quad \Xi_{\mathbf{m}, \mathbf{k}} \text{ is fundamental} \Leftrightarrow \sum_{j \geq 2} k_j \leq 1.$$

Here

$$\varepsilon_1 = \begin{cases} 2 & \text{if } M(\mathbf{m}, \mathbf{k}) = n, \\ 1 & \text{if } M(\mathbf{m}, \mathbf{k}) < n, \end{cases}$$

$$\varepsilon_2 = \begin{cases} 2 & \text{if } M(\mathbf{m}, \mathbf{k}) = n \text{ and } m_{2\nu} = k_{\nu+1} = 0 \quad (\nu = 1, 2, \dots), \\ 1 & \text{otherwise.} \end{cases}$$

Moreover we have easily the following proposition if Σ is of type A_n .

Proposition 10.6 (type A_n). *Let $\Xi_{\mathbf{m}} = \sum_{j \geq 1} m_j A_j$. Then*

$$(10.25) \quad \text{Hom}(\Xi_{\mathbf{m}}, A_n) \neq \emptyset \Leftrightarrow M(\mathbf{m}) \leq n + 1$$

and if $M(\mathbf{m}) \leq n + 1$, we have

$$(10.26) \quad \#\overline{\text{Hom}}(\Xi_{\mathbf{m}}, A_n) = 2^{\sum_{j \geq 2} m_j},$$

$$(10.27) \quad \#(\overline{\text{Hom}}(\Xi_{\mathbf{m}}, A_n) / \text{Out}(\Xi_{\mathbf{m}})) = 1,$$

$$(10.28) \quad \#(\text{Out}(A_n) \setminus \overline{\text{Hom}}(\Xi_{\mathbf{m}}, A_n)) = \begin{cases} 1 & (\sum_{j \geq 2} m_j = 0), \\ 2^{(\sum_{j \geq 2} m_j) - 1} & (\sum_{j \geq 2} m_j > 0), \end{cases}$$

$$(10.29) \quad \Xi_{\mathbf{m}}^\perp \cap A_n \simeq A_{n-M(\mathbf{m})},$$

$$(10.30) \quad \bar{\Xi}_{\mathbf{m}} = \Xi_{\mathbf{m}} \Leftrightarrow \sum_{j \geq 1} m_j \leq 1 \text{ and } M(\mathbf{m}) \neq n.$$

Any subsystem of A_n is fundamental.

We explain some symbols used in the above table.

Remark 10.7. i) In the table above we use following notation.

$$\begin{aligned} \Sigma^L &:= \{\alpha \in \Sigma; |\beta| \leq |\alpha| \quad (\forall \beta \in \Sigma)\}, \\ A_m^S &\simeq A_m^L \simeq A_m, \quad A_m^L \subset \Sigma^L, \quad A_m^S \cap \Sigma^L = \emptyset, \\ D_m^S &\simeq D_m^L \simeq D_m, \quad D_m^L \subset \Sigma^L, \quad D_m^S \cap \Sigma^L = \emptyset. \end{aligned}$$

ii) The symbols $]'$ and $]''$ in the column Σ .

Suppose Σ is irreducible and of exceptional type. Then $\#\overline{\text{Hom}}(\Xi, \Sigma)/\text{Out}(\Xi) \leq 2$. When $\#\overline{\text{Hom}}(\Xi, \Sigma)/\text{Out}(\Xi) = 2$, Σ is of type E_7 or E_8 and then the symbols $[\Xi]'$ and $[\Xi]''$ are used in [Dy] to distinguish the equivalence classes of the imbeddings $\Xi \subset \Sigma$. Then $[\Xi]'$ means that there is a representative in the equivalence class such that

$$(10.31) \quad \Xi \subset A_n \subset \Sigma = E_n$$

with $n = 7$ or 8 . For example, $\#\overline{\text{Hom}}(4A_1, E_7)/\text{Out}(4A_1) = 2$ and the symbols $[4A_1]'$ and $[4A_1]''$ are used in [Dy], which are expressed by $]'$ and $]''$ respectively in the column Σ in our table (cf. (7.6)).

iii) The structure of $\text{Out}_\Sigma(\Xi)$.

If $(\#) = \#\text{Out}(\Xi)$ or $(\#) = 1$ in the table, it follows from (10.2) that $\#\text{Out}_\Sigma(\Xi) = 1$ or $\text{Out}_\Sigma(\Xi) \xrightarrow{\sim} \text{Out}(\Xi)$, respectively. In the column P in the table, a reference such as §8.2.3 gives the description of $\text{Out}_\Sigma(\Xi)$ for other non-trivial cases.

If $\Xi = \Xi_1 + \Xi_2 \subset \Xi' = \Xi_1 + \Xi_1^\perp \subset \Sigma$ and $\text{Out}(\Xi) \xleftarrow{\sim} \text{Out}(\Xi_1) \times \text{Out}(\Xi_2)$ and $\Xi^\perp = \emptyset$, we have

$$(10.32) \quad \text{Out}_\Sigma(\Xi) \simeq N_{\text{Aut}_\Sigma(\Xi')}(\Xi_2)/W_\Xi.$$

The symbol $\subset \Xi'$ is indicated in the column P if $\text{Out}_\Sigma(\Xi)$ is easily obtained by this relation. For example, $\text{Out}_{E_8}(D_5 + A_2)$ is isomorphic to $\text{Out}_{E_8}(D_5 + A_3)$ through the imbedding $D_5 + A_2 \subset D_5 + A_3 \subset E_8$.

The Graduate School of Mathematical Sciences was established in the University of Tokyo in April, 1992. Formerly there were two departments of mathematics in the University of Tokyo: one in the Faculty of Science and the other in the College of Arts and Sciences. All faculty members of these two departments have moved to the new graduate school, as well as several members of the Department of Pure and Applied Sciences in the College of Arts and Sciences. In January, 1993, the preprint series of the former two departments of mathematics were unified as the Preprint Series of the Graduate School of Mathematical Sciences, The University of Tokyo. For the information about the preprint series, please write to the preprint series office.
